## APPENDIX F: Proof of Theorem 0

## F.1. Preliminaries

In THIS SECTION, WE PROVE Theorem 0, which extends the characterizations of REU representations in Gul and Pesendorfer (2006) and Ahn and Sarver (2013) to allow for an arbitrary separable metric space $X$ of outcomes. Refer to Section 2.1 of the main text for all relevant notation and terminology. Throughout, we fix some $y^{*} \in X$ and let $\tilde{\mathbb{R}}^{X}=\{0\} \times \mathbb{R}^{X \backslash\left\{y^{*}\right\}}$ denote the set of utility functions $u$ in $\mathbb{R}^{X}$ that are normalized by $u\left(y^{*}\right)=0$.

We first define the static analog of $S$-based representations introduced in Appendix A:
Definition 13: An $S$-based REU representation of $\rho$ is a tuple ( $S, \mu,\left\{U_{s}, \tau_{s}\right\}_{s \in S}$ ) such that
(i) $S$ is a finite state space and $\mu$ is a probability measure on $S$ such that $\operatorname{supp}(\mu)=S$,
(ii) for each $s \in S$, the utility $U_{s} \in \tilde{\mathbb{R}}^{X}$ is nonconstant and $U_{s} \not \approx U_{s^{\prime}}$ for $s \neq s^{\prime}$,
(iii) for each $s \in S$, the tie-breaking rule $\tau_{s}$ is a proper finitely-additive probability measure on $\tilde{\mathbb{R}}^{X}$ endowed with the Borel sigma-algebra,
(iv) for all $p \in \Delta(X)$ and $A \in \mathcal{A}$,

$$
\rho(p ; A)=\sum_{s \in S} \mu(s) \tau_{s}(p, A),
$$

where $\tau_{s}(p, A):=\tau_{s}\left(\left\{u \in \tilde{\mathbb{R}}^{X}: p \in M\left(M\left(A, U_{s}\right), u\right)\right\}\right)$.
Analogous arguments as for the DREU part of Proposition A. 1 yield the equivalence of $S$-based REU representations and static REU representations.

PROPOSITION F.1: Let $\rho$ be a stochastic choice rule on $\mathcal{A}$. Then $\rho$ admits an REU representation if and only if it admits an $S$-based REU representation.

Proof: Analogous to Proposition A.1(i).
Q.E.D.

[^0]Thus, Theorem 0 is equivalent to the following result, which we prove throughout the rest of this section.

THEOREM F.1: The stochastic choice rule $\rho$ on $\mathcal{A}$ satisfies Axiom 0 if and only if $\rho$ admits an $S$-based REU representation ( $S, \mu,\left\{U_{s}, \tau_{s}\right\}_{s \in S}$ ).

Note that because $X$ may be infinite, continuity of each $U_{s}$ in the representation is not directly implied by linearity. However, the following additional Axiom ensures this. As in Section 3.3, let $\mathcal{A}^{*}$ denote the collection of menus without ties, that is, the set of all $A \in \mathcal{A}$ such that, for any $p \in A$ and any sequences $p^{n} \rightarrow^{m} p$ and $B^{n} \rightarrow^{m} A \backslash\{p\}$, we have $\lim _{n \rightarrow \infty} \rho\left(p^{n} ; B^{n} \cup\left\{p^{n}\right\}\right)=\rho(p ; A)$.

AxıOM F.1—Continuity: $\rho: \mathcal{A}^{*} \rightarrow \Delta(\Delta(X))$ is continuous.
Here $\mathcal{A}$ is endowed with the Hausdorff topology induced by the Prokhorov metric $\pi$ on $\Delta(X)$, and $\mathcal{A}^{*}$ with the relative topology. We have the following proposition.

Proposition F.2: Suppose $\rho$ admits an $S$-based REU representation $\left(S, \mu,\left\{U_{s}, \tau_{s}\right\}_{s \in S}\right)$. Then $\rho$ satisfies Axiom F. 1 if and only if each utility $U_{s}$ is continuous.

Proof: See Section F.5. Q.E.D.

Additional notation: For any $Y \subseteq X$, let $\mathcal{A}(Y):=\{A \in \mathcal{A}: \forall p \in A, \operatorname{supp}(p) \subseteq Y\} \subseteq \mathcal{A}$ denote the space of all menus consisting only of lotteries with support in $Y$. Note that for each $A \in \mathcal{A}$, there is a finite $Y$ such that $A \in \mathcal{A}(Y)$. We denote by $\rho^{Y}$ the restriction of $\rho$ to $\mathcal{A}(Y)$, which can be seen as a map from $\mathcal{A}(Y)$ to $\Delta\left(\Delta(Y)\right.$ ). If $y^{*} \in Y$, we write $\tilde{\mathbb{R}}^{Y}:=\{0\} \times \mathbb{R}^{Y \backslash\left\{y^{*}\right\}}$.

For any $A \in \mathcal{A}(Y)$ and $p \in \Delta(X)$, let $N_{Y}(A, p):=\left\{u \in \tilde{\mathbb{R}}^{Y}: p \in M(A, u)\right\}$ and let $N_{Y}^{+}(A, p):=\left\{u \in \tilde{\mathbb{R}}^{Y}:\{p\}=M(A, u)\right\}$. Note that $N_{Y}(\{p\}, p)=N_{Y}^{+}(\{p\}, p)=\tilde{\mathbb{R}}^{Y}$ and that $N_{Y}(A, p)=N_{Y}^{+}(A, p)=\emptyset$ if $p \notin A$. Let $\mathcal{N}(Y):=\left\{N_{Y}(A, p): A \in \mathcal{A}(Y)\right.$ and $p \in$ $\Delta(X)\}, \mathcal{N}^{+}(Y):=\left\{N_{Y}^{+}(A, p): A \in \mathcal{A}(Y)\right.$ and $\left.p \in \Delta(X)\right\}$.

We will consider both the Borel sigma-algebra on $\tilde{\mathbb{R}}^{Y}$ and its subalgebra $\mathcal{F}(Y)$ that is generated by $\mathcal{N}(Y) \cup \mathcal{N}^{+}(Y)$. A finitely-additive probability measure $\nu^{Y}$ on either of these algebras is called proper if $\nu^{Y}\left(N_{Y}(A, p)\right)=\nu^{Y}\left(N_{Y}^{+}(A, p)\right)$ for any $A \in \mathcal{A}(Y)$ and $p \in \Delta(X)$. Whenever $Y=X$, we omit $Y$ from the description of $N_{Y}(A, p), N_{Y}^{+}(A, p)$, $\mathcal{N}(Y), \mathcal{N}^{+}(Y)$, and $\mathcal{F}(Y)$.

## F.2. Proof of Theorem F.1: Sufficiency

## F.2.1. Outline

The proof proceeds as follows:
(i) In Section F.2.2, we use conditions (i)-(iv) of Axiom 0 and Theorem 2 in Gul and Pesendorfer (2006) to construct, for each finite $Y \subseteq X$, a proper finitely-additive probability measure $\nu^{Y}$ on $\mathcal{F}(Y)$ representing $\rho^{Y}$, in the sense that $\rho^{Y}(p ; A)=\nu^{Y}\left(N_{Y}(A, p)\right)$ for all $A, p$. Given the fact that each $\rho^{Y}$ is derived from the same $\rho$, it is easy to check that the family $\left\{\mathcal{F}(Y), \nu^{Y}\right\}$ is Kolmogorov consistent. We can then find a proper finitely-additive probability measure $\nu$ on $\mathcal{F}$ extending all the $\nu^{Y}$ (and hence representing $\rho$ ).
(ii) The support of $\nu$ is defined by

$$
\operatorname{supp}(\nu):=(\bigcup\{V \in \mathcal{F}: V \text { is open and } \nu(V)=0\})^{c}
$$

In Section F.2.3, we use part (v) of Axiom 0 to show that supp $\nu$ is finite (up to positive affine transformation of utilities) and contains at least one nonconstant utility function. While Axiom 0(v) is similar to the finiteness Axiom in Ahn and Sarver (2013), this step requires more work in our setting. A key technical challenge is that unlike in Ahn and Sarver, it is not clear in our infinite outcome space setting how to normalize utilities to ensure that $N(A, p)$-sets are compact. Compact sets $C$ have the useful property (used repeatedly by Ahn and Sarver) that if $C \cap \operatorname{supp} \nu=\emptyset$, then $\nu(C)=0$. Lemma F. 5 exploits the geometry of $N(A, p)$-sets to show that this property continues to hold for $N(A, p)$ sets in our setting, even though they are not compact.
(iii) In Section F.2.4, we proceed in a similar way to the proof of Theorem S3 in Ahn and Sarver (2013) (again using Lemma F. 5 to circumvent technical difficulties). Letting $S:=\left\{s_{1}, \ldots, s_{L}\right\}$ denote the equivalence classes of nonconstant utilities in supp $\nu$, we find separating neighborhoods $B_{s} \in \mathcal{F}$ of each $s$ such that $\nu\left(B_{s}\right)>0$. We then define $\mu(s)=$ $\nu\left(B_{s}\right)$ and $\tau_{s}(V)=\frac{\nu\left(V \cap B_{s}\right)}{\nu\left(B_{s}\right)}$ and show that this yields an $S$-based REU representation of $\rho$.

## F.2.2. Construction of $\nu$

In this section, we construct a proper finitely-additive probability measure $\nu$ on $\mathcal{F}$ that represents $\rho$, that is, such that for all $A \in \mathcal{A}$ and $p \in A$, we have

$$
\left.\rho(p ; A)=\nu(N(A, p))=\nu\left(N^{+}(A, p)\right)\right) .
$$

First consider any finite $Y \subseteq X$ with $y^{*} \in Y$. By Axiom 0(i)-(iv) (Regularity, Linearity, Extremeness, and Mixture Continuity), Theorem 2 in Gul and Pesendorfer (2006) ensures that there is a proper finitely-additive probability measure $\nu^{Y}$ on $\mathcal{F}^{Y}$ such that

$$
\rho^{Y}(p ; A)=\nu^{Y}\left(N_{Y}(A, p)\right)=\nu^{Y}\left(N_{Y}^{+}(A, p)\right)
$$

for all $A \in \mathcal{A}(Y)$ and $p \in A$.
CLAIM 4: For any finite $Y^{\prime} \supseteq Y \ni y^{*},\left(\nu^{Y^{\prime}}, \mathcal{F}\left(Y^{\prime}\right)\right)$ and $\left(\nu^{Y}, \mathcal{F}(Y)\right)$ are Kolmogorov consistent, that is, for any $E \in \mathcal{F}(Y)$, we have

$$
\begin{equation*}
\nu^{Y^{\prime}}\left(E \times \mathbb{R}^{Y^{\prime} \backslash Y}\right)=\nu^{Y}(E) \tag{24}
\end{equation*}
$$

Proof: To see this, note first that the LHS of (24) is well-defined, since $E \times$ $\mathbb{R}^{Y^{\prime} \backslash Y} \in \mathcal{F}^{Y^{\prime}}$ by Lemma F.4(iv). Note next that by Lemma F.4(iii), $E$ is of the form $\bigcup_{i=1}^{n} N_{Y}\left(A_{i}, p_{i}\right) \cap N_{Y}^{+}\left(B_{i}, q_{i}\right)$ for some finite $n$ and $A_{i}, B_{i} \in \mathcal{A}(Y)$. Let $E^{\prime}$ be obtained from $E$ by replacing each $N_{Y}\left(A_{i}, p_{i}\right)$ with $N_{Y}^{+}\left(A_{i}, p_{i}\right)$. By Lemma F.4(ii), $E^{\prime}=$ $\bigcup_{i=1}^{n} N_{Y}^{+}\left(C_{i}, r_{i}\right)$ for some family $\left\{C_{i}\right\} \subseteq \mathcal{A}(Y)$. Moreover, since both $\nu^{Y}$ and $\nu^{Y^{\prime}}$ are proper, we have that $\nu^{Y}(E)=\nu^{Y}\left(E^{\prime}\right)$ and $\nu^{Y^{\prime}}\left(E \times \mathbb{R}^{Y^{\prime} \backslash Y}\right)=\nu^{Y^{\prime}}\left(E^{\prime} \times \mathbb{R}^{Y^{\prime} \backslash Y}\right)$. Hence, it suffices to prove that $\nu^{Y^{\prime}}\left(E^{\prime} \times \mathbb{R}^{Y^{\prime} \backslash Y}\right)=\nu^{Y}\left(E^{\prime}\right)$. For this, it is enough to show that for any collection of sets $N_{1}^{+}, \ldots, N_{n}^{+} \in \mathcal{N}^{+}(Y):=\left\{N^{+}(A, p): A \in \mathcal{A}(Y)\right\}$, we have $\nu^{Y}\left(\bigcup_{i=1}^{n} N_{i}^{+}\right)=\nu^{Y^{\prime}}\left(\bigcup_{i=1}^{n} N_{i}^{+} \times \mathbb{R}^{Y^{\prime} \backslash Y}\right)$. We prove this by induction. For the base case, note that for any $N^{+}(A, p) \in \mathcal{N}^{+}(Y)$, we have

$$
\left.\nu^{Y^{\prime}}\left(N^{+}(A, p)\right) \times \mathbb{R}^{Y^{\prime} \backslash Y}\right)=\rho^{Y^{\prime}}(p, A):=\rho(p ; A)=: \rho^{Y}(p ; A)=\nu^{Y}\left(N^{+}(A, p)\right) .
$$

Suppose next that the claim is true whenever $m<n$. Then

$$
\begin{aligned}
\nu^{Y}\left(\bigcup_{i=1}^{m+1} N_{i}^{+}\right)= & \nu^{Y}\left(\bigcup_{i=1}^{m} N_{i}^{+}\right)+\nu^{Y}\left(N_{m+1}^{+}\right)-\nu^{Y}\left(\bigcup_{i=1}^{m}\left(N_{i}^{+} \cap N_{m+1}^{+}\right)\right) \\
= & \nu^{Y^{\prime}}\left(\bigcup_{i=1}^{m} N_{i}^{+} \times \mathbb{R}^{Y^{\prime} \backslash Y}\right)+\nu^{Y^{\prime}}\left(N_{m+1}^{+} \times \mathbb{R}^{Y^{\prime} \backslash Y}\right) \\
& -\nu^{Y^{\prime}}\left(\bigcup_{i=1}^{m}\left(N_{i}^{+} \cap N_{m+1}^{+}\right) \times \mathbb{R}^{Y^{\prime} \backslash Y}\right) \\
= & \nu^{Y^{\prime}}\left(\bigcup_{i=1}^{m+1} N_{i}^{+} \times \mathbb{R}^{Y^{\prime} \backslash Y}\right),
\end{aligned}
$$

where the second equality follows from the inductive hypothesis and the fact that $N_{i}^{+} \cap$ $N_{m+1}^{+} \in \mathcal{N}^{+}(Y)$ by Lemma F.4(ii).
Q.E.D.

Now define $\nu$ on $\mathcal{F}$ by setting $\nu(E):=\nu^{Y}\left(\operatorname{pro}_{\mathfrak{\mathbb { R }}_{\tilde{Y}}} E\right)$ for any finite $Y \ni y^{*}$ such that $E=$ $\operatorname{proj}_{\tilde{\mathbb{R}}^{Y}} E \times \mathbb{R}^{X \backslash Y}$ and $\operatorname{proj}_{\tilde{\mathbb{R}}^{Y}} E \in \mathcal{F}^{Y}$. By Lemma F.4(iv), such a $Y$ exists. Moreover, given Kolmogorov consistency of the family $\left\{\nu^{Y}\right\}_{Y \subseteq X}$, this is well-defined. Finally, it is immediate that $\nu$ is a proper finitely-additive probability measure and that $\nu$ represents $\rho$.

## F.2.3. Finiteness of $\operatorname{supp} \nu$

The support of a finitely-additive probability measure $\nu$ is defined by

$$
\operatorname{supp}(\nu):=(\bigcup\{V \in \mathcal{F}: V \text { is open and } \nu(V)=0\})^{c} .
$$

The next lemma invokes Axiom 0 (v) (Finiteness) to show that the support of $\nu$ constructed in the previous section contains finitely many equivalence classes of utility functions and contains at least one nonconstant function. We use 0 to denote the unique constant utility function in $\tilde{\mathbb{R}}^{X}$.

Lemma F.1: Let $K$ be as in the statement of the Finiteness Axiom and let $\operatorname{Pref}(\Delta(X))$ denote the set of all preferences over $\Delta(X)$. Then

$$
\#\{\succsim \in \operatorname{Pref}(\Delta(X)): \succsim \text { is represented by some } u \in \operatorname{supp}(\nu) \backslash\{0\}\}=L
$$

where $1 \leq L \leq K$.
Proof: We first show that $L \leq K$. If not, then we can find utilities $\left\{u_{1}, \ldots, u_{K+1}\right\} \subseteq$ $\operatorname{supp}(\nu)$ such that each $u_{i}$ is nonconstant over $X$ and $u_{i} \not \approx u_{j}$ for all $i \neq j$. By Lemma E.2, we can find a menu $A=\left\{p^{i}: i=1, \ldots, K+1\right\} \in \mathcal{A}$ such that $u_{i} \in N^{+}\left(A, p^{i}\right)$ for each $i$. Take any $B \subseteq A$ with $|B| \leq K$. Then $p^{i} \notin B$ for some $i$.

Fix any sequences $p_{n}^{i} \rightarrow^{m} p^{i}$ and $B_{n} \rightarrow^{m} B$. By definition, this means that there exist $r \in \Delta(X)$ and $\alpha_{n} \rightarrow 0$ such that $p_{n}^{i}=\alpha_{n} r+(1-\alpha) p^{i}$ for all $n$, and that, for each $q \in B$, there exist $B_{q} \in \mathcal{A}$ and $\beta_{n}(q) \rightarrow 0$ such that $B_{n}=\bigcup_{q \in B}\left(\beta_{n}(q) B_{q}+\left(1-\beta_{n}(q)\right)\{q\}\right)$ for all $n$. Now, $B$ and each $B_{q}$ are finite, and $u_{i}$ is linear with $u_{i} \cdot p^{i}>u_{i} \cdot q$ for all $q \in B$. Hence, there
is $N$ such that for all $n \geq N, u_{i} \cdot p_{n}^{i}>u \cdot q_{n}$ for all $q_{n} \in B_{n}$. Thus, $u_{i} \in N^{+}\left(\left\{p_{n}^{i}\right\} \cup B_{n}, p_{n}^{i}\right)$ for all $n \geq N$. But since $u_{i} \in \operatorname{supp}(\nu)$ and $N^{+}\left(\left\{p_{n}^{i}\right\} \cup B_{n}, p_{n}^{i}\right)$ is an open set in $\mathcal{F}$, the definition of $\operatorname{supp}(\nu)$ then implies that $\nu\left(N^{+}\left(\left\{p_{n}^{i}\right\} \cup B_{n}, p_{n}^{i}\right)\right)>0$ for all $n \geq N$. But then $\rho\left(p_{n}^{i} ;\left\{p_{n}^{i}\right\} \cup B_{n}\right)=\nu\left(N^{+}\left(\left\{p_{n}^{i}\right\} \cup B_{n}, p_{n}^{i}\right)\right)>0$ for all $n \geq N$, contradicting Finiteness.

Next we show that $L \geq 1$. Indeed, if $L=0$, then for any $A \in \mathcal{A}$ with $|A| \geq 2$ and for any $p \in A$, we have $(N(p, A) \backslash\{0\}) \cap \operatorname{supp} \nu=\emptyset$. By Lemma F. 5 below, this implies that $\nu\left(N^{+}(p, A)\right)=0$ for any $p \in A$. But since $\nu$ represents $\rho, \rho(p ; A)=\nu\left(N^{+}(p, A)\right)$ for any $p \in A$, so we have $\sum_{p \in A} \rho(p ; A)=0$, which is a contradiction.
Q.E.D.

## F.2.4. Constructing the REU Representation

Let $\succsim_{1}, \ldots, \succsim_{L}$ denote all the preferences represented by some nonconstant utility in $\operatorname{supp}(\nu)$, where by Lemma F. 1 we know that $L$ is finite and $L \geq 1$. For each $i=1, \ldots, L$, pick some $u_{i} \in \operatorname{supp} \nu$ representing $\succsim_{i}$. For any $u \in \tilde{\mathbb{R}}^{X}$, let $[u]:=\left\{u^{\prime} \in \tilde{\mathbb{R}}^{X}: u^{\prime} \approx u\right\}$. By Lemma E.2, we can find $A:=\left\{p_{1}, \ldots, p_{L}\right\} \in \mathcal{A}$ such that $u_{i} \in N^{+}\left(A, p_{i}\right)$ for all $i=1, \ldots, L$. Let $B_{u_{i}}:=N^{+}\left(A, p_{i}\right)$ for all $i$. By construction, $\left[u_{i}\right] \subseteq B_{u_{i}}$ and $B_{u_{i}} \cap B_{u_{j}}=\emptyset$ for $j \neq i$. Moreover, by the definition of $\operatorname{supp}(\nu)$, we have $\nu\left(B_{u_{i}}\right)>0$ for each $i$, since $B_{u_{i}} \in \mathcal{F}$ is open and $u_{i} \in B_{u_{i}} \cap \operatorname{supp}(\nu) \neq \emptyset$.
Let $S:=\left\{u_{1}, \ldots, u_{L}\right\}$ and define the function $\mu: S \rightarrow[0,1]$ by

$$
\mu(s)=\nu\left(B_{s}\right) \quad \text { for each } s \in S
$$

We claim that $\mu$ defines a full-support probability measure on $S$. For this, it remains to show that $\sum_{s} \mu(s)=1$. Since $\sum_{s} \mu(s)=\sum_{s} \nu\left(B_{s}\right)=\nu\left(\bigcup_{s \in S} B_{s}\right)$, it suffices to prove the following claim:

LEMMA F.2: $\nu\left(\bigcup_{s \in S} B_{s}\right)=1$.
Proof: It suffices to prove that $\nu\left(\tilde{\mathbb{R}}^{X} \backslash \bigcup_{s \in S} B_{s}\right)=0$. Note that $\tilde{\mathbb{R}}^{X}=\bigcup_{i=1}^{L} N\left(A, p_{i}\right)$, since $A=\left\{p_{i}, \ldots, p_{L}\right\}$. Thus,

$$
\tilde{\mathbb{R}}^{X} \backslash \bigcup_{s \in S} B_{s} \subseteq \bigcup_{i=1}^{L}\left(N\left(A, p_{i}\right) \backslash N^{+}\left(A, p_{i}\right)\right)
$$

By finite additivity of $\nu$, this implies that

$$
\nu\left(\tilde{\mathbb{R}}^{X} \backslash \bigcup_{s \in S} B_{s}\right) \leq \sum_{i=1}^{L} \nu\left(N\left(A, p_{i}\right) \backslash N^{+}\left(A, p_{i}\right)\right)=0
$$

where the last inequality follows from properness of $\nu$.
Next, we define a set function $\tau_{s}: \mathcal{F} \rightarrow \mathbb{R}_{+}$for each $s \in S$ by setting

$$
\tau_{s}(V):=\frac{\nu\left(V \cap B_{s}\right)}{\nu\left(B_{s}\right)}
$$

for each $V \in \mathcal{F}$. Since $\nu\left(B_{s}\right)>0$ for all $s \in S$, this is well-defined. Moreover, since $\nu$ is a proper finitely-additive probability measure on $\mathcal{F}$, so is $\tau_{s}$.

Note that for all $A \in \mathcal{A}$ and $p \in \Delta(X),\left\{u \in \tilde{\mathbb{R}}^{X}: p \in M(M(A, s), u)\right\}=N(M(A, s)$, $p) \in \mathcal{F}$, so $\tau_{s}\left(\left\{u \in \tilde{\mathbb{R}}^{X}: p \in M(M(A, s), u)\right\}\right)$ is well-defined. The next lemma will allow us to complete the representation:

Lemma F.3: For each $s \in S, A \in \mathcal{A}$, and $p \in A$,

$$
\nu(N(A, p))=\sum_{s \in S} \mu(s) \tau_{s}\left(\left\{u \in \tilde{\mathbb{R}}^{X}: p \in M(M(A, s), u)\right\}\right) .
$$

Proof: We first show that for each $s \in S$, supp $\tau_{s} \backslash\{0\}=[s]$. To see that $[s] \subseteq \operatorname{supp} \tau_{s} \backslash$ $\{0\}$, consider any $u \in[s]$ and any open $V \in \mathcal{F}$ such that $u \in V$. By Lemma F.4(iii), $V$ is a finite union of finite intersections of sets in $\mathcal{N} \cup \mathcal{N}^{+}$. Hence, since each element of $\mathcal{N} \cup \mathcal{N}^{+}$is closed under positive affine transformations, so is $V$. Thus, $u \in V$ implies $s \in V$. But then $V \cap B_{s} \in \mathcal{F}$ is open and contains $s$, and hence $\nu\left(V \cap B_{s}\right)>0$ since $s \in \operatorname{supp} \nu$. This proves $u \in \operatorname{supp} \tau_{s} \backslash\{0\}$.

To see that $\operatorname{supp} \tau_{s} \backslash\{0\} \subseteq[s]$, consider any $u \neq 0$ such that $u \notin[s]$. It suffices to show that there exists an open $V \in \mathcal{F}$ such that $u \in V$ and $\tau_{s}(V)=0$. If $u \approx s^{\prime}$ for some $s^{\prime} \in$ $S \backslash\{s\}$, then $V=B_{s^{\prime}}$ is as required since $B_{s^{\prime}} \cap B_{s}=\emptyset$ and $u \in B_{s^{\prime}}$. If there is no $s^{\prime} \in S \backslash\{s\}$ such that $u \approx s^{\prime}$, then $u \notin \operatorname{supp} \nu$. But then there exists an open $V \in \mathcal{F}$ such that $u \in V$ and $\nu(V)=0$, so also $\tau_{s}(V)=0$.

By Lemma F. 6 below, this implies that $\tau_{s}(N(A, p))=\tau_{s}(N(M(A, s), p))$ for any $A \in$ $\mathcal{A}$ and $p \in A$. This implies that for any $A \in \mathcal{A}$ and $p \in A$,

$$
\begin{aligned}
\sum_{s \in S} \mu(s) \tau_{s}\left(\left\{u \in \tilde{\mathbb{R}}^{X}: p \in M(M(A, s), u)\right\}\right) & =\sum_{s \in S} \mu(s) \tau_{s}(N(M(A, s), p)) \\
& =\sum_{s \in S} \mu(s) \tau_{s}(N(A, p)) \\
& =\sum_{s \in S} \nu\left(N(A, p) \cap B_{s}\right) \\
& =\nu\left(N(A, p) \cap \bigcup_{s \in S} B_{s}\right) \\
& =\nu(N(A, p)
\end{aligned}
$$

where the last equality follows from Lemma F.2.
Q.E.D.

For any $s \in S=\left\{u_{1}, \ldots, u_{L}\right\}$, we write $U_{s}:=s$. We claim that $\left(S, \mu,\left\{U_{s}, \tau_{s}\right\}_{s \in S}\right)$ is an $S$-based REU representation of $\rho$. Indeed, by construction, $U_{s}$ is nonconstant for all $s, U_{s} \not \approx U_{s^{\prime}}$ for any distinct $s, s^{\prime} \in S$, and $\mu$ is a full-support probability measure on $S$. Moreover, each $\tau_{s}$ is a proper finitely-additive probability measure on $\tilde{\mathbb{R}}^{X}$ endowed with the algebra $\mathcal{F}$. By standard arguments (cf. Rao and Rao (2012)), we can extend $\tau_{s}$ to a proper finitely-additive probability measure on the Borel sigma-algebra on $\tilde{\mathbb{R}}^{X}$. Finally, Lemma F. 3 and the fact that $\nu$ represents $\rho$ implies that, for all $A \in \mathcal{A}$ and $p \in A$, we have $\rho(p ; A)=\sum_{s \in S} \mu(s) \tau_{s}(p, A)$, as required.

## F.3. Proof of Theorem F.1: Necessity

Suppose that $\rho$ admits an $S$-based REU representation ( $S, \mu,\left\{U_{s}, \tau_{s}\right\}_{s \in S}$ ). We show that $\rho$ satisfies Axiom 0. Observe first that for any finite $Y \subseteq X$ with $y^{*} \in Y,(S, \mu$, $\left\{U_{s} \upharpoonright_{Y}, \tau_{s} \upharpoonright_{Y}\right\}_{s \in S}$ ) constitutes an $S$-based REU representation of $\rho^{Y}$, where $U_{s} \upharpoonright_{Y}$ denotes the restriction of $U_{s}$ to $Y$ and $\tau_{s} \upharpoonright_{Y}$ is given by $\tau_{s} \upharpoonright_{Y}(B)=\tau_{s}\left(B \times \mathbb{R}^{X \backslash Y}\right)$ for any Borel
set $B$ on $\mathbb{R}^{Y}$. Thus, by Theorem S3 in Ahn and Sarver (2013), $\rho^{Y}$ satisfies Regularity, Linearity, Extremeness, and Mixture Continuity.

To show that $\rho$ satisfies Regularity, consider any $p \in A \subseteq A^{\prime}$. Pick a finite $Y \subseteq X$ with $y^{*} \in Y$ such that $A, A^{\prime} \in \mathcal{A}(Y)$. By definition, $\rho(p ; A)=\rho^{Y}(p ; A)$ and $\rho\left(p ; A^{\prime}\right)=$ $\rho^{Y}\left(p ; A^{\prime}\right)$. Hence, by Regularity for $\rho^{Y}$, we have $\rho(p ; A) \geq \rho\left(p ; A^{\prime}\right)$, as required. Similarly, we can show that $\rho$ satisfies Linearity, Extremeness, and Mixture Continuity by using the fact that for each finite $Y$, each $\rho^{Y}$ satisfies these axioms.

Finally, to show that $\rho$ satisfies Finiteness, let $K:=|S|$ and consider any $A \in \mathcal{A}$. For each $s \in S$, pick any $q_{s} \in M\left(A, U_{s}\right)$, and define $B:=\left\{q_{s}: s \in S\right\}$. Note that $|B| \leq K$. If $B=A$, then Finiteness is trivially satisfied. If $B \subsetneq A$, then pick any $p \in A \backslash B$. We can pick a large enough finite $Y \subseteq X$ such that each $U_{s}$ is nonconstant on $Y$ and $U_{s} \upharpoonright_{Y} \not \approx U_{s^{\prime}} \upharpoonright_{Y}$ for any distinct $s, s^{\prime} \in S$. Let $r \in \Delta(Y)$ be given by $r(y):=\frac{1}{|Y|}$ for each $y \in Y$. For each $s \in Y$, pick any $y_{s} \in \operatorname{argmax}_{y \in Y} U_{s}(y)$. Note that $U_{s}\left(y_{s}\right)>U_{s}(r)$. Define $B^{n}:=\frac{n-1}{n} B+\frac{1}{n}\left\{y_{s}: s \in S\right\}$ and $p^{n}:=\frac{n-1}{n} p+\frac{1}{n} r$. Then $B^{n} \rightarrow{ }^{m} B$ and $p_{n} \rightarrow^{m} p$. Moreover, for all large enough $n$, we have $U_{s}\left(\frac{n-1}{n} q_{s}+\frac{1}{n} y_{s}\right)>U_{s}\left(p^{n}\right)$ for each $s \in S$. Thus, $\rho\left(p^{n} ;\left\{p^{n}\right\} \cup B^{n}\right)=0$, proving Finiteness.

## F.4. Additional Lemmas for Section F

## F.4.1. Properties of $N(A, p)$-Sets

Lemma F.4: Fix any $X^{\prime} \subseteq X$ with $y^{*} \in X$. For any collection $\mathcal{S}$, we let $\mathcal{U}(\mathcal{S})$ denote the set of all finite unions of elements of $\mathcal{S}$.
(i) If $E \in \mathcal{N}\left(X^{\prime}\right)\left(r e s p . E \in \mathcal{N}^{+}\left(X^{\prime}\right)\right)$, then $E^{c} \in \mathcal{U}\left(\mathcal{N}^{+}\left(X^{\prime}\right)\right)$ (resp. $E^{c} \in \mathcal{U}\left(\mathcal{N}\left(X^{\prime}\right)\right)$.
(ii) If $E_{1}, E_{2} \in \mathcal{N}\left(X^{\prime}\right)\left(\right.$ resp. $E_{1}, E_{2} \in \mathcal{N}^{+}\left(X^{\prime}\right)$ ), then $E_{1} \cap E_{2} \in \mathcal{N}\left(X^{\prime}\right)$ (resp. $E_{1} \cap E_{2} \in$ $\left.\mathcal{N}^{+}\left(X^{\prime}\right)\right)$.
(iii) $\mathcal{F}\left(X^{\prime}\right)$ is the set of all $E$ such that $E=\bigcup_{\ell \in L} M_{\ell} \cap N_{\ell}$ for some finite index set $L$ and $M_{\ell} \in \mathcal{N}\left(X^{\prime}\right), N_{\ell} \in \mathcal{N}^{+}\left(X^{\prime}\right)$ for each $\ell \in L$.
(iv) $\mathcal{F}\left(X^{\prime}\right)$ is the set of all $E$ for which there exists a finite $Y \subseteq X^{\prime}$ with $y^{*} \in Y$ and $E^{Y} \in$ $\mathcal{F}(Y)$ such that $E=E^{Y} \times \mathbb{R}^{X \backslash Y}$.

PROOF: (i) If $E=N(A, p) \in \mathcal{N}\left(X^{\prime}\right)$, then $E^{c}=\bigcup_{q \in A \backslash\{p\}} N^{+}(\{p, q\}, q) \in \mathcal{U}\left(\mathcal{N}^{+}\left(X^{\prime}\right)\right)$ if $p \in A$ and $E^{c}=\tilde{\mathbb{R}}^{X^{\prime}} \in \mathcal{U}\left(\mathcal{N}^{+}\left(X^{\prime}\right)\right)$ if $p \notin A$. Similarly, if $E=N^{+}(A, p) \in \mathcal{N}^{+}\left(X^{\prime}\right)$, then $E^{c}=\bigcup_{q \in A \backslash\{p\}} N(\{p, q\}, q) \in \mathcal{U}\left(\mathcal{N}\left(X^{\prime}\right)\right)$ if $p \in A$ and $E^{c}=\tilde{\mathbb{R}}^{X^{\prime}} \in \mathcal{U}\left(\mathcal{N}\left(X^{\prime}\right)\right)$ if $p \notin A$.
(ii) If $N\left(A_{1}, p_{1}\right), N\left(A_{2}, p_{2}\right) \in \mathcal{N}\left(X^{\prime}\right)$, then $N\left(A_{1}, p_{1}\right) \cap N\left(A_{2}, p_{2}\right)=N\left(\frac{1}{2} A_{1}+\right.$ $\left.\frac{1}{2} A_{2}, \frac{1}{2} p_{1}+\frac{1}{2} p_{2}\right) \in \mathcal{N}\left(X^{\prime}\right)$. The same argument goes through replacing all instances of $N$ with $N^{+}$.
(iii) By standard results, $\mathcal{F}\left(X^{\prime}\right)$ can be described as follows: Let $\mathcal{F}_{0}\left(X^{\prime}\right)$ denote the set of all elements of $\mathcal{N}\left(X^{\prime}\right) \cup \mathcal{N}^{+}\left(X^{\prime}\right)$ and their complements. Let $\mathcal{F}_{1}\left(X^{\prime}\right)$ denote the set of all finite intersections of elements of $\mathcal{F}_{0}\left(X^{\prime}\right)$. Then $\mathcal{F}\left(X^{\prime}\right)$ is the set of all finite unions of elements of $\mathcal{F}_{1}\left(X^{\prime}\right)$. By part (i), $\mathcal{F}_{0}(X)=\mathcal{U}(N(X)) \cup \mathcal{U}\left(N\left(X^{\prime}\right)\right)$ is the collection of all finite unions of elements of $\mathcal{N}\left(X^{\prime}\right)$ and of all finite unions of elements of $\mathcal{N}^{+}\left(X^{\prime}\right)$. By part (ii), $\mathcal{F}_{1}\left(X^{\prime}\right)=\mathcal{F}_{0}(X) \cup \mathcal{I}\left(X^{\prime}\right)$, where $\mathcal{I}\left(X^{\prime}\right)$ consists of all finite unions of the form $\bigcup_{\ell \in L} M_{\ell} \cap N_{\ell}$, where $M_{\ell} \in \mathcal{N}\left(X^{\prime}\right)$ and $N_{\ell} \in \mathcal{N}^{+}\left(X^{\prime}\right)$ for each $\ell \in L$. Note that $\tilde{\mathbb{R}}^{X^{\prime}} \in \mathcal{N}\left(X^{\prime}\right) \cap \mathcal{N}^{+}\left(X^{\prime}\right)$, since $\tilde{\mathbb{R}}^{X^{\prime}}=N_{X^{\prime}}(\{p\}, p)=N_{X^{\prime}}^{+}(\{p\}, p)$ for any $p \in \Delta\left(X^{\prime}\right)$. Thus, $\mathcal{F}_{0}(X)=\mathcal{U}(N(X)) \cup \mathcal{U}\left(N\left(X^{\prime}\right)\right) \subseteq \mathcal{I}(X)$. Hence, $\mathcal{F}_{1}(X)=\mathcal{I}(X)=\mathcal{F}(X)$.
(iv) Note first that for any $N_{X^{\prime}}(A, p) \in \mathcal{N}\left(X^{\prime}\right)\left(\right.$ resp. $\left.N_{X^{\prime}}^{+}(A, p) \in \mathcal{N}^{+}\left(X^{\prime}\right)\right)$ and any finite $Y \subseteq X^{\prime}$ with $y^{*} \in Y$ and $A \in \mathcal{A}(Y)$, we have $N_{X^{\prime}}(A, p)=N_{Y}(A, p) \times \mathbb{R}^{X^{\prime} \backslash Y}$ (resp.
$\left.N_{X^{\prime}}^{+}(A, p)=N_{Y}^{+}(A, p) \times \mathbb{R}^{X^{\prime} \backslash Y}\right)$. Now fix any $E \in \mathcal{F}\left(X^{\prime}\right)$. By part (iv), we have a finite index set $L$ and $M_{\ell} \in \mathcal{N}\left(X^{\prime}\right), N_{\ell} \in \mathcal{N}^{+}\left(X^{\prime}\right)$ for each $\ell \in L$ such that $E=\bigcup_{\ell \in L} M_{\ell} \cap N_{\ell}$. By the first sentence, we can then pick a finite $Y \subseteq X^{\prime}$ with $y^{*} \in Y$ such that for each $\ell$, we have $M_{\ell}=M_{\ell}^{Y} \times \mathbb{R}^{X^{\prime} \backslash Y}$ and $N_{\ell}=N_{\ell}^{Y} \times \mathbb{R}^{X^{\prime} \backslash Y}$, where $M_{\ell}^{Y} \in \mathcal{N}(Y)$ and $N_{\ell}^{Y} \in \mathcal{N}^{+}(Y)$. Then $E=E^{Y} \times \mathbb{R}^{X \backslash Y}$, where $E^{Y}:=\bigcup_{\ell \in L} M_{\ell}^{Y} \cap N_{\ell}^{Y} \in \mathcal{F}(Y)$. Conversely, if $E^{Y} \in \mathcal{F}(Y)$, then by part (iv), $E^{Y}$ is of the form $\bigcup_{\ell \in L} M_{\ell}^{Y} \cap N_{\ell}^{Y} \in \mathcal{F}(Y)$ for some finite collection of $M_{\ell}^{Y} \in \mathcal{N}(Y)$ and $N_{\ell}^{Y} \in \mathcal{N}^{+}(Y)$. Then by the first sentence, $M_{\ell}:=M_{\ell}^{Y} \times \mathbb{R}^{X^{\prime} \backslash Y} \in \mathcal{N}\left(X^{\prime}\right)$ and $N_{\ell}=N_{\ell}^{Y} \times \mathbb{R}^{X^{\prime} \backslash Y} \in \mathcal{N}^{+}\left(X^{\prime}\right)$, so $\left.E^{Y} \times \mathbb{R}^{X^{\prime} \backslash Y}=\bigcup_{\ell=1}^{L} M_{\ell} \cap N_{\ell}\right) \in \mathcal{F}\left(X^{\prime}\right)$ by part (iv).
Q.E.D.

## F.4.2. Properties of Proper Finitely-Additive Probability Measures on $\mathcal{F}$

LEMMA F.5: Let $\nu$ be a proper finitely-additive probability measure on $\mathcal{F}$ and suppose that $(N(p, A) \backslash\{0\}) \cap \operatorname{supp} \nu=\emptyset$ for some $A \in \mathcal{A}$ and $p \in A$, where 0 denotes the unique constant utility in $\tilde{\mathbb{R}}^{X}$. Then $\nu\left(N^{+}(A, p)\right)=\nu(N(A, p))=0$.

Proof: Since $(N(A, p) \backslash\{0\}) \cap \operatorname{supp} \nu=\emptyset$, we have

$$
N(A, p) \backslash\{0\} \subseteq(\operatorname{supp} \nu)^{c}:=\bigcup\{V \in \mathcal{F}: V \text { open and } \nu(V)=0\}
$$

Thus, for some possibly infinite index set $I$, there exists a family $\left\{V_{i}\right\}_{i \in I}$, with $V_{i} \in \mathcal{F}$ open and $\nu\left(V_{i}\right)=0$ for each $i$ such that

$$
N(A, p) \backslash\{0\} \subseteq \bigcup_{i \in I} V_{i}
$$

We now show that there is a finite subset $\left\{i_{1}, \ldots, i_{n}\right\} \subseteq I$ such that

$$
N(A, p) \backslash\{0\} \subseteq \bigcup_{j=1}^{n} V_{i_{j}}
$$

To see this, define $L(A, p):=\left(N(A, p) \cap[-1,1]^{X}\right) \backslash\{0\}$. Note that since $[-1,1]^{X}$ is compact in $\mathbb{R}^{X}$ (by Tychonoff's theorem) and $N(A, p)$ is closed in $\tilde{\mathbb{R}}^{X}, C(A, p)$ is compact in the relative topology on $\tilde{\mathbb{R}}^{X} \backslash\{0\}$. Hence, since $L(A, p) \subseteq N(A, p) \backslash\{0\}$ is covered by $\bigcup_{i \in I} V_{i}$ and each $V_{i}$ is open, it has a finite subcover $\bigcup_{j=1}^{n} V_{i_{j}}$.

We claim that $N(A, p) \backslash\{0\}$ is also covered by $\bigcup_{j=1}^{n} V_{i_{j}}$. To see this, consider any $u^{*} \in N(A, p) \backslash\{0\}$. We can find a finite $Y \subseteq X$ such that $y^{*} \in Y, u^{*} \upharpoonright_{Y}$ is not constant, $N(A, p)=N_{Y}(A, p) \times \mathbb{R}^{X \backslash Y}$, and for each $j=1, \ldots, n, V_{i_{j}}=V_{i_{j}}^{Y} \times \mathbb{R}^{X \backslash Y}$ for some $V_{i_{j}}^{Y} \in \mathcal{F}^{Y}$ (see Lemma F.4(iv)).

Since $Y$ is finite, there exists $\alpha>0$ small enough such that $\alpha u^{*}(y) \in[-1,1]$ for all $y \in Y$. Define $u \in \tilde{\mathbb{R}}^{X}$ by $u \upharpoonright_{Y}=\alpha u^{*} \upharpoonright_{Y}$ and $u(x)=0$ for all $x \in X \backslash Y$. Note that $u \in$ $N(A, p)$ : Indeed, $u^{*} \in N(A, p)=N_{Y}(A, p) \times \mathbb{R}^{X \backslash Y}, u \upharpoonright_{Y}=\alpha u^{*} \upharpoonright_{Y}$, and $N_{Y}(A, p)$ is closed under positive scaling. Moreover, $u$ is not constant, since $u^{*} \upharpoonright_{Y}$ is not constant. Finally, $u \in[-1,1]^{X}$. This shows $u \in L(A, p)$. Since $L(A, p)$ is covered by $\bigcup_{j=1}^{n} V_{i j}$, there exists $j$ such that $u \in V_{i_{j}}=V_{i_{j}}^{Y} \times \mathbb{R}^{X \backslash Y}$. But note that $V_{i_{j}}^{Y}$ is closed under positive scaling, since, by Lemma F.4(iii), it is a finite union of sets which are closed under positive scaling. Since $u \upharpoonright_{Y}=\alpha u^{*} \upharpoonright_{Y}$, this implies $u^{*} \in V_{i_{j}}$.

The above shows that $N(A, p) \backslash\{0\}$ is covered by $\bigcup_{j=1}^{n} V_{i j}$, and hence so is $N^{+}(A, p)$. But since $\nu\left(V_{i_{j}}\right)=0$ for all $j=1, \ldots, n$ and $\nu$ is finitely additive, it follows that $\nu\left(N^{+}(A, p)\right)=0$. Moreover, by properness of $\nu$, this implies $\nu(N(A, p))=0$. Q.E.D.

LEMMA F.6: Suppose $\nu$ is a proper finitely-additive probability measure on $\mathcal{F}$ and $\operatorname{supp} \nu \backslash$ $\{0\}=[u]$ for some $u \in \tilde{\mathbb{R}}^{X}$. Then for any $A \in \mathcal{A}$ and $p \in A$, we have $\nu(N(A, p))=$ $\nu(N(M(A, u), p))$.

Proof: Fix any $A \in \mathcal{A}$ and $p \in A$. Note first that for any $q \in A$,

$$
\begin{equation*}
q \notin M(A, u) \quad \Rightarrow \quad \nu(N(A, q))=0 . \tag{25}
\end{equation*}
$$

Indeed, if $q \notin M(A, u)$, then $\emptyset=[u] \cap N(A, q)=(N(A, q) \backslash\{0\}) \cap \operatorname{supp} \nu$. But then Lemma F. 5 implies that $\nu(N(A, q))=0$, as claimed.

Suppose now that $p \notin M(A, u)$. Then (25) implies that $\nu(N(A, p))=0$. Moreover, $N(B, p):=\emptyset$ if $p \notin B$, so also $\nu(N(M(A, u), p))=0$, as required.

Suppose next that $p \in M(A, u)$. Then

$$
N(A, p) \subseteq N(M(A, u), p) \subseteq N(A, p) \cup \bigcup_{q \in A \backslash M(A, u)} N(A, q)
$$

so that
$\nu(N(A, p)) \leq \nu(N(M(A, u), p)) \leq \nu(N(A, p))+\sum_{q \in A \backslash M(A, u)} \nu(N(A, q))=\nu(N(A, p))$,
where the last equality follows from (25). This again shows that $\nu(N(A, p))=$ $\nu(N(M(A, u), p))$, as required.
Q.E.D.

## F.5. Proof of Proposition F. 2

"Only if" direction: We prove the contrapositive. Suppose that there exist some $s^{\prime} \in S$ and $x \in X$ such that $\lim _{n} U_{s^{\prime}}\left(x_{n}\right) \neq U_{s^{\prime}}(x)$ for some sequence $x_{n} \rightarrow x$. Since $S$ is finite, by taking an appropriate subsequence of $\left\{x_{n}\right\}$, we can assume that $\lim _{n} U_{s}\left(x_{n}\right)$ exists (allowing for $\pm \infty$ ) for every $s \in S$.
Let $S_{+}:=\left\{s \in S: \lim _{n} U_{s}\left(x_{n}\right)<U_{s}(x)\right\}, S_{-}:=\left\{s \in S: \lim _{n} U_{s}\left(x_{n}\right)>U_{s}(x)\right\}$, and $S_{0}:=$ $S \backslash\left(S_{+} \cup S_{-}\right)$. Then there exist $\gamma>0$ and $N$ such that for all $n \geq N, U_{s}\left(x_{n}\right)+2 \gamma<U_{s}(x)$ for all $s \in S_{+}$and $U_{s}\left(x_{n}\right)>U_{s}(x)+2 \gamma$ for all $s \in S_{-}$. Let $p=\alpha \delta_{x}+(1-\alpha) \delta_{x_{N}}$. By setting $\alpha$ sufficiently large, we can guarantee that for all $n \geq N, U_{s}\left(x_{n}\right)+\gamma<U_{s}(p)$ for all $s \in S_{+}$ and $U_{s}\left(x_{n}\right)>U_{s}(p)+\gamma$ for all $s \in S_{-}$. Note also that $U_{s}(x)>U_{s}(p)+2 \gamma(1-\alpha)$ for all $s \in S_{+}$and $U_{s}(x)+2 \gamma(1-\alpha)<U_{s}(p)$ for all $s \in S_{-}$.

Since $S$ is finite and each $U_{s}$ is nonconstant, we can assume that $U_{s}(p) \neq U_{s}(x)$ for all $s \in S$. (Otherwise, we can replace $p$ with a lottery that is obtained by mixing an appropriate lottery to $p$, without violating the above construction.) This implies that there exist $\gamma^{\prime}>0$ and $N^{\prime}$ such that, for all $s \in S_{0}$, either $\min \left\{U_{s}\left(x_{n}\right), U_{s}(x)\right\}>U_{s}(p)+\gamma^{\prime}$ for all $n \geq N^{\prime}$ or $\max \left\{U_{s}\left(x_{n}\right), U_{s}(x)\right\}+\gamma^{\prime}<U_{s}(p)$ for all $n \geq N^{\prime}$. Let $S_{0-}$ be the set of states in $S_{0}$ that satisfy the former inequality, and $S_{0+}$ be the set of states in $S_{0}$ that satisfy the latter inequality.

Let $m:=|S|$. By Lemma E.2, we can find distinct lotteries $\left\{q_{1}, \ldots, q_{m}\right\}$ such that $U_{s_{i}} \in N^{+}\left(\left\{q_{1}, . ., q_{m}\right\}, q_{i}\right)$ for each $s_{i} \in S$. Define $p_{i}=(1-\varepsilon) p+\varepsilon q_{i}$ for each $s_{i} \in S$, and
$A:=\left\{p_{1}, \ldots, p_{m}, \delta_{x}\right\}$ and $A_{n}:=\left\{p_{1}, \ldots, p_{m}, \delta_{x_{n}}\right\}$. By construction, if we take $\varepsilon$ sufficiently small, then for all $n \geq \max \left\{N, N^{\prime}\right\}$,

$$
\begin{aligned}
& {\left[U_{s_{i}} \in N^{+}\left(A_{n}, p_{i}\right) \cap N^{+}\left(A, \delta_{x}\right), \forall s_{i} \in S_{+}\right]} \\
& {\left[U_{s_{i}} \in N^{+}\left(A_{n}, \delta_{x_{n}}\right) \cap N^{+}\left(A, p_{i}\right), \forall s_{i} \in S_{-}\right]} \\
& {\left[U_{s_{i}} \in N^{+}\left(A_{n}, \delta_{x_{n}}\right) \cap N^{+}\left(A, \delta_{x}\right), \forall s_{i} \in S_{0-}\right]} \\
& {\left[U_{s_{i}} \in N^{+}\left(A_{n}, p_{i}\right) \cap N^{+}\left(A, p_{i}\right), \forall s_{i} \in S_{0+}\right] .}
\end{aligned}
$$

By Lemma E.3, $A, A_{n} \in \mathcal{A}^{*}$ for all $n \geq \max \left\{N, N^{\prime}\right\}$. Note that $S_{+} \cup S_{-} \neq \emptyset$ by assumption. Take any $s_{i} \in S_{+} \cup S_{-}$. If $s_{i} \in S_{+}$, then $\rho\left(p_{i} ; A_{n}\right)=\mu\left(s_{i}\right)$ for every $n \geq \max \left\{N, N^{\prime}\right\}$ and $\rho\left(p_{i} ; A\right)=0$. If $s_{i} \in S_{-}$, then $\rho\left(p_{i} ; A_{n}\right)=0$ for every $n \geq \max \left\{N, N^{\prime}\right\}$ and $\rho\left(p_{i} ; A\right)=$ $\mu\left(s_{i}\right)$. In either case, Axiom F. 1 is violated.
"If" direction: Suppose each $U_{s}$ is continuous. Take any sequence $A_{n} \rightarrow A$ of menus that converge under the Hausdorff metric such that $A, A_{n} \in \mathcal{A}^{*}$ for each $n$. Enumerate the elements in $A$ by $A=\left\{p_{1}, \ldots, p_{m}\right\}$, where we can assume up to relabeling that, for some $k \leq m$, we have $\rho\left(p_{i} ; A\right)>0$ for each $i=1, \ldots, k$ and $\rho\left(p_{i} ; A\right)=0$ for each $i=$ $k+1, \ldots, m$. For each $i=1, \ldots, k$, define $S_{i}:=\left\{s \in S: M\left(A, U_{s}\right)=\left\{p_{i}\right\}\right\}$. Note that by Lemma E.3, $S=\bigcup_{i} S_{i}$ since $A \in \mathcal{A}^{*}$.

Take any $B$ that is a continuity set under $\rho(\cdot ; A)$. For each $i=1, \ldots, k$, we have either $p_{i} \in \operatorname{int} B$ or $p_{i} \in \operatorname{int}(\Delta(X) \backslash B)$. We can pick $\varepsilon>0$ sufficiently small such that:
(i) $B_{\varepsilon}\left(p_{i}\right) \subseteq \operatorname{int} B$ if $p_{i} \in \operatorname{int} B$, and $B_{\varepsilon}\left(p_{i}\right) \subseteq \operatorname{int}(\Delta(X) \backslash B)$ if $p_{i} \in \operatorname{int}(\Delta(X) \backslash B)$,
(ii) for any $i, j=1, \ldots, m$ with $i \neq j$, we have $B_{\varepsilon}\left(p_{i}\right) \cap B_{\varepsilon}\left(p_{j}\right)$,
(iii) for any $i=1, \ldots, k, j=1, \ldots, m$ with $i \neq j, q_{i} \in B_{\varepsilon}\left(p_{i}\right)$, and $q_{j} \in B_{\varepsilon}\left(p_{j}\right)$, we have $U_{s_{i}}\left(q_{i}\right)>U_{s_{i}}\left(q_{j}\right)$ for all $s_{i} \in S_{i}$.
Here $B_{\varepsilon}(\cdot)$ denotes $\varepsilon$-neighborhoods with respect to the Prokhorov metric $\pi$, and (iii) holds by the assumption that each $U_{s}$ is continuous. Since $A_{n} \rightarrow A$, there exists $N$ such that for all $n \geq N$, we have the following: (a) for each $q \in A_{n}$, there exists $i=1, \ldots, m$ such that $q \in B_{\varepsilon}\left(p_{i}\right)$; and (b) for each $i=1, \ldots, m$, there exists $q \in A_{n}$ such that $q \in$ $B_{\varepsilon}\left(p_{i}\right)$. For such $n \geq N$, we then have $M\left(A_{n}, U_{s_{i}}\right) \in B_{\varepsilon}\left(p_{i}\right)$ for each $i=1, \ldots, k$ and $s_{i} \in$ $S_{i}$. Thus $\rho\left(B ; A_{n}\right)=\sum_{i=1}^{k} \mu\left(S_{i}\right)=\rho(B ; A)$. By the Portmanteau theorem, this guarantees that $\rho\left(\cdot ; A_{n}\right) \rightarrow \rho(\cdot ; A)$ under weak convergence, as claimed.

## APPENDIX G: Proofs for Section 5

## G.1. Proof of Proposition 1

The first part is immediate from the i.i.d. full-support assumption on $\varepsilon$. To show the second part, suppose that $v_{1}\left(z_{1}\right)<v_{1}\left(z_{1}^{\prime}\right)$. We consider the equivalent problem of scaling $v$ terms by $\alpha:=\frac{1}{\lambda}>0$ while fixing $\varepsilon$ terms. That is, we write

$$
\begin{aligned}
U_{0}\left(z_{0}, A_{1}^{\mathrm{big}}\right) & =\alpha v_{0}\left(z_{0}\right)+\varepsilon_{0}^{\left(z_{0}, A_{1}^{\text {big }}\right)}+\delta \mathbb{E}\left[\max \left\{\alpha v_{1}\left(z_{1}\right)+\varepsilon_{1}^{z_{1}}, \alpha v_{1}\left(z_{1}^{\prime}\right)+\varepsilon_{1}^{z_{1}^{\prime}}\right\}\right], \\
U_{0}\left(z_{0}, A_{1}^{\text {small }}\right) & =\alpha v_{0}\left(z_{0}\right)+\varepsilon_{0}^{\left(z_{0}, A_{1}^{\text {small }}\right)}+\delta \alpha v_{1}\left(z_{1}\right),
\end{aligned}
$$

where the second line used the fact that $\varepsilon_{1}^{z_{1}}$ has mean zero.
By the i.i.d. full-support assumption on $\varepsilon_{0}$, the desired claim follows if we show that the difference $U_{0}\left(z_{0}, A_{1}^{\text {big }}\right)-U_{0}\left(z_{0}, A_{1}^{\text {small }}\right)$ is decreasing in $\alpha$. To show this, suppose without
loss of generality that $v_{0}\left(z_{0}\right)=0$. Then, for all $\alpha$, the derivatives of the utilities satisfy

$$
\frac{d U\left(z_{0}, A_{1}^{\mathrm{big}}\right)}{d \alpha}=\delta\left(\rho_{1}\left(z_{1}, A_{1}^{\mathrm{big}}\right) v_{1}\left(z_{1}\right)+\rho_{1}\left(z_{1}^{\prime}, A_{1}^{\mathrm{big}}\right) v_{1}\left(z_{1}^{\prime}\right)\right), \quad \frac{d U\left(z_{0}, A_{1}^{\text {small }}\right)}{d \alpha}=\delta v_{1}\left(z_{1}^{\prime}\right)
$$

where we can suppress the dependence on histories in $\rho_{1}$ since $\varepsilon$ shocks are i.i.d. Moreover, letting $f$ denote the density of the $\varepsilon$ shocks and setting $\kappa\left(\varepsilon_{1}^{z_{1}^{\prime}}\right):=\alpha\left(v_{1}\left(z_{1}^{\prime}\right)-v_{1}\left(z_{1}\right)\right)+$ $\varepsilon_{1}^{z_{1}^{\prime}}$, we have that $\rho_{1}\left(z_{1}, A_{1}^{\mathrm{big}}\right)=\int_{-\infty}^{\infty} \int_{\kappa\left(\varepsilon_{1}^{z_{1}^{\prime}}\right)}^{\infty} f\left(\varepsilon_{1}^{z_{1}}\right) d \varepsilon_{1}^{z_{1}} f\left(\varepsilon_{1}^{z_{1}^{\prime}}\right) d \varepsilon_{1}^{z_{1}^{\prime}}$ and $\rho_{1}\left(z_{1}^{\prime}, A_{1}^{\text {big }}\right)=1-$ $\rho_{1}\left(z_{1}, A_{1}^{\mathrm{big}}\right)$. Note that both choice probabilities are strictly positive since the $\varepsilon_{1}$ shocks are i.i.d. with full support. Thus, $v_{1}\left(z_{1}\right)<v_{1}\left(z_{1}^{\prime}\right)$ implies $\frac{d U\left(z_{0}, A_{1}^{\text {big }}\right)}{d \alpha}<\frac{d U\left(z_{0}, A_{1}^{\text {small }}\right)}{d \alpha}$ for all $\alpha$, as required.

## G.2. Proof of Proposition 2

$B E U$ : For BEU, we have

$$
\begin{aligned}
U_{0}\left(x, A_{1}^{\text {early }}\right) & =\mathbb{E}\left[\max \left\{\mathbb{E}\left[u_{2}(y) \mid \mathcal{F}_{1}\right], \mathbb{E}\left[u_{2}(z) \mid \mathcal{F}_{1}\right]\right\} \mid \mathcal{F}_{0}\right], \\
U_{0}\left(x, A_{1}^{\text {late }}\right) & =\mathbb{E}\left[\mathbb{E}\left[\max \left\{u_{2}(y), u_{2}(z)\right\} \mid \mathcal{F}_{1}\right] \mid \mathcal{F}_{0}\right] .
\end{aligned}
$$

By the conditional Jensen inequality and convexity of the max operator, $U_{0}\left(x, A_{1}^{\text {earl }}\right) \leq$ $U_{0}\left(x, A_{1}^{\text {late }}\right)$. Moreover, this inequality is strict at $\omega$ as long as there exist $\omega^{\prime}, \omega^{\prime \prime} \in \mathcal{F}_{0}(\omega)$ with $\mathcal{F}_{1}\left(\omega^{\prime}\right)=\mathcal{F}_{1}\left(\omega^{\prime \prime}\right)$ such that $u_{2}(y)-u_{2}(z)$ changes sign on $\left\{\omega^{\prime}, \omega^{\prime \prime}\right\}$.
i.i.d. $D D C$ : For i.i.d. DDC, to simplify the notation we assume $v_{0}(x)=v_{1}(x)=0$ without loss of generality. Take a measurable function $\sigma: \mathbb{R}^{2} \rightarrow[0,1]$ such that

$$
\sigma\left(\varepsilon^{y}, \varepsilon^{z}\right) \in \underset{\alpha \in[0,1]}{\operatorname{argmax}} \alpha\left(v_{2}(y)+\varepsilon^{y}\right)+(1-\alpha)\left(v_{2}(z)+\varepsilon^{z}\right)
$$

for all $\left(\varepsilon^{y}, \varepsilon^{z}\right) \in \mathbb{R}^{2} . .^{83}$ Then $U_{0}\left(x, A_{1}^{\text {late }}\right)-\varepsilon_{0}^{\left(x, A_{1}^{\text {late }}\right)}$ is equal to

$$
\begin{aligned}
\delta^{2} \mathbb{E} & {\left[\max \left\{v_{2}(y)+\varepsilon_{2}^{y}, v_{2}(z)+\varepsilon_{2}^{z}\right\}\right] } \\
& =\delta^{2} \mathbb{E}\left[\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right)\left(v_{2}(y)+\varepsilon_{2}^{y}\right)+\left(1-\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right)\right)\left(v_{2}(z)+\varepsilon_{2}^{z}\right)\right] \\
& =\delta^{2}\left(\alpha^{*} v_{2}(y)+\left(1-\alpha^{*}\right) v_{2}(z)\right)+\delta^{2} \mathbb{E}\left[\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right) \varepsilon_{2}^{y}+\left(1-\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right)\right) \varepsilon_{2}^{z}\right]
\end{aligned}
$$

where $\alpha^{*}:=\mathbb{E}\left[\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right)\right]$. Since $\varepsilon_{2}^{y}$ and $\varepsilon_{2}^{z}$ have mean zero, $\delta^{2}\left(\alpha^{*} v_{2}(y)+\left(1-\alpha^{*}\right) v_{2}(z)\right)$ in the last line is equal to the expected value the agent would obtain from $A_{1}^{\text {late }}$ if, in period 2 , she chooses $y$ with probability $\alpha^{*}$ regardless of the realization of $\varepsilon_{2}$. Since such a decision rule is strictly suboptimal at $A_{1}^{\text {late }}$ under the full-support assumption on $\varepsilon_{2}$, the term $\delta^{2} \mathbb{E}\left[\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right) \varepsilon_{2}^{y}+\left(1-\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right)\right) \varepsilon_{2}^{z}\right]$ in the last line is strictly positive. At the same time, $U_{0}\left(x, A_{1}^{\text {early }}\right)-\varepsilon_{0}^{\left(x, A_{1}^{\text {early }}\right)}$ is equal to

$$
\begin{aligned}
\delta \mathbb{E} & {\left[\max \left\{\delta v_{2}(y)+\varepsilon_{1}^{(x,\{y\})}, \delta v_{2}(z)+\varepsilon_{1}^{(x,\{z\})}\right\}\right] } \\
& \geq \delta \mathbb{E}\left[\sigma\left(\varepsilon_{1}^{(x,\{y\})}, \varepsilon_{1}^{(x,\{z\})}\right)\left(\delta v_{2}(y)+\varepsilon_{1}^{(x,\{y\})}\right)+\left(1-\sigma\left(\varepsilon_{1}^{(x,\{y\})}, \varepsilon_{1}^{(x,\{z\})}\right)\right)\left(\delta v_{2}(z)+\varepsilon_{1}^{(x,\{z\})}\right)\right] \\
& =\delta^{2}\left(\alpha^{*} v_{2}(y)+\left(1-\alpha^{*}\right) v_{2}(z)\right)+\delta \mathbb{E}\left[\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right) \varepsilon_{2}^{y}+\left(1-\sigma\left(\varepsilon_{2}^{y}, \varepsilon_{2}^{z}\right)\right) \varepsilon_{2}^{z}\right],
\end{aligned}
$$

[^1]where the inequality follows since the value in the second line is the expected payoff if the agent follows the decision rule $\sigma$ at $A_{1}^{\text {early }}$. The equality holds by the i.i.d. assumption on $\varepsilon_{1}$ and $\varepsilon_{2}$. Since $\delta \in(0,1)$, it follows that $U_{0}\left(x, A_{1}^{\text {early }}\right)-\varepsilon_{0}^{\left(x, A_{1}^{\text {early }}\right)}>U_{0}\left(x, A_{1}^{\text {late }}\right)-\varepsilon_{0}^{\left(x, A_{1}^{\text {late }}\right)}$. Thus, the desired claim follows from the i.i.d. assumption on $\varepsilon_{0}$.
"Moreover" part: We consider the equivalent problem in which we scale $v$ terms by a scaling factor $\alpha:=\frac{1}{\lambda}>0$ while fixing $\varepsilon$ terms. Assume $v_{2}(y)>v_{2}(z)$ without loss of generality. Then,
\[

$$
\begin{aligned}
U_{0}\left(x, A_{1}^{\text {early }}\right) & =\varepsilon_{0}^{\left(x, A_{1}^{\text {early }}\right)}+\delta \mathbb{E}\left[\max \left\{\delta \alpha v_{2}(y)+\varepsilon_{1}^{x,\{y\}}, \delta \alpha v_{2}(z)+\varepsilon_{1}^{x,\{z\}}\right\}\right] \\
U_{0}\left(x, A_{1}^{\text {late }}\right) & =\varepsilon_{0}^{\left(x, A_{1}^{\text {late })}\right.}+\delta^{2} \mathbb{E}\left[\max \left\{\alpha v_{2}(y)+\varepsilon_{2}^{y}, \alpha v_{2}(z)+\varepsilon_{2}^{z}\right\}\right]
\end{aligned}
$$
\]

By the i.i.d full-support assumption on $\varepsilon_{0}$, the desired claim follows if we show that $U_{0}\left(x, A_{1}^{\text {early }}\right)-U_{0}\left(x, A_{1}^{\text {late }}\right)$ is strictly decreasing in $\alpha$. As in the proof of Proposition 1 , the derivatives of utilities with respect to $\alpha$ satisfy

$$
\begin{aligned}
\frac{d U_{0}\left(x, A_{1}^{\text {early }}\right)}{d \alpha} & =\delta^{2}\left(\rho_{1}\left((x,\{y\}) ; A_{1}^{\text {early }}\right) v_{2}(y)+\rho_{1}\left((x,\{z\}) ; A_{1}^{\text {early }}\right) v_{2}(z)\right) \\
\frac{d U_{0}\left(x, A_{1}^{\text {late }}\right)}{d \alpha} & =\delta^{2}\left(\rho_{2}(y ;\{y, z\}) v_{2}(y)+\rho_{2}(z ;\{y, z\}) v_{2}(z)\right)
\end{aligned}
$$

where we can again suppress the dependence of choice probabilities on histories due to the i.i.d. $\varepsilon$ assumption. But note that

$$
\begin{aligned}
\rho_{1}\left((x,\{y\}) ; A_{1}^{\text {early }}\right) & =\operatorname{Pr}\left[\delta\left(v_{2}(y)-v_{2}(z)\right) \geq \varepsilon_{1}^{x,\{z\}}-\varepsilon_{1}^{x,\{y\}}\right] \\
& <\operatorname{Pr}\left[v_{2}(y)-v_{2}(z) \geq \varepsilon_{2}^{z}-\varepsilon_{2}^{y}\right]=\rho_{2}(y ;\{y, z\}),
\end{aligned}
$$

where the inequality holds since $\delta<1, v_{2}(y)>v_{2}(z)$ and by the i.i.d. full-support assumption on $\varepsilon$. Thus, $\frac{d U_{0}\left(x, A_{1}^{\text {early }}\right)}{d \alpha}<\frac{d U_{0}\left(x, A_{1}^{\text {ate }}\right)}{d \alpha}$, as required.

## G.3. Proof of Proposition 3

Let $G$ denote the cdf of the difference $\varepsilon-\varepsilon^{\prime}$ of two shocks $\varepsilon, \varepsilon^{\prime}$ that are independently drawn from $F$.

Proof of Proposition 3: Because the density of $\varepsilon$ is symmetric and unimodal around $0, G$ dominates $F$ in terms of the peakedness order by Theorem 3.D. 4 in Shaked and Shanthikumar (2007). Thus, $F(\gamma) \geq G(\gamma)$ for any $\gamma>0$ and $F(\gamma) \leq G(\gamma)$ for any $\gamma<0$ by Theorem 3.D. 1 in Shaked and Shanthikumar (2007); moreover, the inequalities are strict because the distribution $F$ has full support.

We express choice probabilities of $a$ in each period as functions of parameters $(w, \delta)$, where we can suppress the dependence on histories by the i.i.d. assumption on shocks. That is, for each model $\mathrm{M}=\mathrm{DDC}, \mathrm{BEU}$, let $\rho_{0}^{\mathrm{M}}(w, \delta):=\rho_{0}^{\mathrm{M}}\left(a ; A_{0}\right)$ and $\rho_{1}^{\mathrm{M}}(w, \delta):=$ $\rho_{1}^{\mathrm{M}}\left(a ; A_{1}\right)$ for each $(w, \delta)$. Let $V(w):=\mathbb{E}\left[\max \left\{w+\varepsilon_{1}^{a}, \varepsilon_{1}^{b}\right\}\right]$. Note that $V(w) \geq 0$ since shocks have mean zero, and the inequality is strict because of the full-support assumption. We have $\rho_{1}^{\mathrm{DDC}}(w, \delta)=\rho_{1}^{\mathrm{BEU}}(w, \delta)=\operatorname{Pr}\left(w+\varepsilon_{1}^{a} \geq \varepsilon_{1}^{b}\right)=G(w)$. Moreover, $\rho_{0}^{\mathrm{DDC}}(w, \delta)=$
$\operatorname{Pr}\left(w+\varepsilon_{0}^{a} \geq \delta V(w)+\varepsilon_{0}^{A_{1}}\right)=1-G(\delta V(w)-w)$. Finally, $\rho_{0}^{\mathrm{BEU}}(w, \delta)=\operatorname{Pr}\left(w+\varepsilon_{0}^{a} \geq\right.$ $\delta V(w))=1-F(\delta V(w)-w)$.

For each model M, we consider the maximization problem

$$
\begin{aligned}
& \max _{(\hat{\omega}, \hat{\delta}) \in \Theta} \rho_{0}\left(a ; A_{0}\right) \log \left[\rho_{0}^{\mathrm{M}}(\hat{w}, \hat{\delta})\right]+\left(1-\rho_{0}\left(a ; A_{0}\right)\right) \log \left[1-\rho_{0}^{\mathrm{M}}(\hat{w}, \hat{\delta})\right] \\
& \quad+\left(1-\rho_{0}\left(a ; A_{0}\right)\right)\left(\rho_{1}\left(a ; A_{1}\right) \log \left[\rho_{1}^{\mathrm{M}}(\hat{w}, \hat{\delta})\right]+\left(1-\rho_{1}\left(a ; A_{1}\right)\right) \log \left[1-\rho_{1}^{\mathrm{M}}(\hat{w}, \hat{\delta})\right]\right)
\end{aligned}
$$

By the assumption that $\rho$ is compatible, for each model $\mathrm{M}=\mathrm{DDC}, \mathrm{BEU}$, there exists $\left(\hat{w}^{\mathrm{M}}, \hat{\delta}^{\mathrm{M}}\right) \in \Theta$ such that

$$
\begin{equation*}
\rho_{0}\left(a ; A_{0}\right)=\rho_{0}^{\mathrm{M}}\left(\hat{w}^{\mathrm{M}}, \hat{\delta}^{\mathrm{M}}\right) \text { and } \rho_{1}\left(a ; A_{1}\right)=\rho_{1}^{\mathrm{M}}\left(\hat{w}^{\mathrm{M}}, \hat{\delta}^{\mathrm{M}}\right) \tag{26}
\end{equation*}
$$

hold. By Gibbs's inequality, $\left(\hat{w}^{\mathrm{M}}, \hat{\delta}^{\mathrm{M}}\right)$ achieves the maximum of the above maximization problem. The latter condition in (26) implies $\hat{w}^{\mathrm{DDC}}=\hat{w}^{\mathrm{BEU}}=G^{-1}\left(\rho_{1}\left(a, A_{1}\right)\right)=: \hat{w}^{*}$ (the value is unique as $G$ is strictly increasing). Then the first condition in (26) implies $1-$ $\rho_{0}\left(a ; A_{0}\right)=G\left(\hat{\delta}^{\mathrm{DDC}} V\left(\hat{w}^{*}\right)-\hat{w}^{*}\right)=F\left(\hat{\delta}^{\mathrm{BEU}} V\left(\hat{w}^{*}\right)-\hat{w}^{*}\right)$ and the corresponding values of $\hat{\delta}^{\mathrm{DDC}}, \hat{\delta}^{\mathrm{BEU}}$ are uniquely determined (as $F, G$ are strictly increasing and $V(\cdot)>0$ ). If $\rho_{0}\left(a ; A_{0}\right)>0.5$, then $\hat{\delta}^{\mathrm{DDC}} V\left(\hat{w}^{*}\right)-\hat{w}^{*}, \hat{\delta}^{\mathrm{BEU}} V\left(\hat{w}^{*}\right)-\hat{w}^{*}<0$. By the observation in the first paragraph, this implies $\hat{\delta}^{\mathrm{DDC}} V\left(\hat{w}^{*}\right)<\hat{\delta}^{\mathrm{BEU}} V\left(\hat{w}^{*}\right)$. Thus, $\hat{\delta}^{\mathrm{DDC}}<\hat{\delta}^{\mathrm{BEU}}$ since $V\left(\hat{w}^{*}\right)>0$. If $\rho_{0}\left(a ; A_{0}\right)<0.5$, a symmetric argument yields $\hat{\delta}^{\mathrm{DDC}}>\hat{\delta}^{\mathrm{BEU}}$.

By standard results (e.g., Theorem 2 in White (1982)), the maximum likelihood estimates $\left(\hat{w}_{n}^{\mathrm{M}}, \hat{\delta}_{n}^{\mathrm{M}}\right)$ for each model M converge almost surely to ( $\hat{w}^{\mathrm{M}}, \hat{\delta}^{\mathrm{M}}$ ). This completes the proof.
Q.E.D.

In Proposition 3, we assumed that distribution $F$ has a symmetric and unimodal density around 0 . While this assumption is satisfied by several commonly used distributions including the probit model, it rules out other instances such as the logit model. The following proposition accommodates such distributions under the assumption that $F$ and $G$ have finite crossings, that is, $|\{\gamma: F(\gamma)=G(\gamma)\}|<\infty$.

Proposition G.1: Suppose that $\rho$ is compatible with both models. If $F$ and $G$ have finite crossings, then there exist $\bar{\alpha}, \underline{\alpha} \in(0,1)$ such that almost surely
(i) $\lim _{n} \hat{w}_{n}^{\mathrm{DDC}}=\lim _{n} \hat{w}_{n}^{\mathrm{BEU}}$,
(ii) $\lim _{n} \hat{\delta}_{n}^{\text {DDC }}<\lim _{n} \hat{\delta}_{n}^{\mathrm{BEU}}$ if $\rho_{0}\left(a ; A_{0}\right)>\bar{\alpha}$ and $\lim _{n} \hat{\delta}_{n}^{\mathrm{DDC}}>\lim _{n} \hat{\delta}_{n}^{\mathrm{BEU}}$ if $\rho_{0}\left(a ; A_{0}\right)<\underline{\alpha}$.

The proposition shows that the same conclusion as in Proposition 3 holds as long as period-0 choice probabilities are relatively extreme. The proof is identical to Proposition 3 except for modifying the first paragraph in the following manner. Note that $F$ and $G$ cross at least once since they have the same mean. By the finite crossing assumption, we can take $\bar{\gamma}$ and $\underline{\gamma}$ to be the largest and smallest crossing points of $F$ and $G$. Since $\varepsilon$ has mean zero, $G$ is a mean-preserving spread of $F$ by construction. Thus, since their means are finite, $\int_{0}^{p} F^{-1}(q) d q \geq \int_{0}^{p} G^{-1}(q) d q$ and $\int_{p}^{1} F^{-1}(q) d q \leq \int_{p}^{1} G^{-1}(q) d q$ hold for any $p \in$ $(0,1)$ (Theorem 3.A. 5 in Shaked and Shanthikumar (2007)). This implies $F(\gamma)<G(\gamma)$ for all $\gamma<\underline{\gamma}$ and $F(\gamma)>G(\gamma)$ for all $\gamma>\bar{\gamma}$. Based on this modification, the remaining proof goes through by defining $\bar{\alpha}:=F(\bar{\gamma})$ and $\underline{\alpha}:=F(\gamma)$.

Finally, while we have assumed that shocks to each option are identically distributed according to $F$, this assumption is also not crucial. In particular, suppose that the shock
distribution can depend on both the option and the time period; that is, for each $x \in$ $\left\{a, b, A_{1}\right\}$ and $t \in\{0,1\}, \varepsilon_{t}^{x}$ follows some mean-zero distribution $F_{t}^{x}$ with full-support density and all shocks are independent. In this more general case, the same argument as above yields the same predictions as Proposition G. 1 as long as $F_{0}^{a}$ and $F_{0}^{A_{1}}$ have finite crossings.

## APPENDIX H: Proofs FOR SEction 6

We use the following preliminary lemma in the proofs.
LEmmA H.1: Take any finite set of nonconstant utilities $\left\{u^{1}, . ., u^{m}\right\} \subseteq \mathbb{R}^{Z}$ and a convex set $D \subseteq \mathbb{R}^{Z}$ such that $\left\{u^{1}, . ., u^{m}\right\} \cap[D] \neq \emptyset$. Suppose there exist $\bar{\ell}, \underline{\ell} \in \Delta(Z)$ such that $u^{i}(\bar{\ell})>$ $u^{i}(\underline{\ell})$ for each $i=1, \ldots, m$. Then there exist a finite set $L \subseteq \Delta \overline{(Z)}$ and $\ell^{*} \in \operatorname{int} \Delta(Z)$ such that $(i)\left|M\left(L, u^{i}\right)\right|=1$ for all $u^{i}$, (ii) $M\left(L, u^{i}\right)=\left\{\ell^{*}\right\}$ if and only if $u^{i} \in[D]$.

PROOF: We suppose $\left\{u^{1}, \ldots, u^{m}\right\} \nsubseteq[D]$, because otherwise we can take any lottery $\ell^{*} \in$ int $\Delta(Z)$ and set $L=\left\{\ell^{*}\right\}$. For convenience, we relabel the utilities such that $u^{i} \in[D]$ for $i=1, \ldots, k$ and $u^{i} \notin[D]$ for $i=k+1, \ldots, m$. By the affine aggregation theorem (e.g., Theorem 2 in Fishburn (1984)), for any $u \in \mathbb{R}^{Z}$, the following statements are equivalent:
(i) for any $w \in \mathbb{R}^{Z}$ such that $\sum_{z \in Z} w(z)=0$,

$$
\left[\forall i=1, \ldots, k, u^{i} \cdot w \leq 0\right] \Rightarrow u \cdot w \leq 0
$$

(ii) $u \in\left[\operatorname{co}\left\{u^{1}, \ldots, u^{k}\right\}\right]$.

Note that by definition for any $i=k+1, \ldots, m, u^{i}$ does not belong to $\left[\cos \left\{u^{1}, \ldots, u^{k}\right\}\right] \subseteq$ [ $D$ ]. Thus, by the above equivalence result, for each $i=k+1, \ldots, m$, we can find a vector $w^{i} \in \mathbb{R}^{Z}$ with $\sum_{z \in Z} w^{i}(z)=0$ such that $u^{i} \cdot w^{i}>0 \geq u^{j} \cdot w^{i}$ for any $j=1, \ldots, k$. Fix any $\ell \in \operatorname{int} \Delta(Z)$. For each $i=k+1, \ldots, m$, we construct $\ell(i) \in \Delta(Z)$ such that the vector $\ell(i)-\ell\left(\right.$ in $\mathbb{R}^{Z}$ ) is proportional to $w^{i}$. Note that such a construction is possible because $\ell$ is in the interior of $\Delta(Z)$. Thus, $u^{j}(\ell) \geq \max _{i=k+1, \ldots, m} u^{j}(\ell(i))$ for each $j=1, \ldots, k$ and $u^{i}(\ell)<u^{i}(\ell(i))$ for each $i=k+1, \ldots, m$.

Let $\ell^{*}:=\ell+\varepsilon(\bar{\ell}-\underline{\ell})$, where $\varepsilon>0$ is small enough so that the lottery is well-defined (this is possible because $\ell$ is in the interior). By choosing $\varepsilon$ small, we can guarantee that $u^{j}\left(\ell^{*}\right)>\max _{i=k+1, \ldots, m} u^{j}(\ell(i))$ for each $j=1, \ldots, k$ and $u^{i}\left(\ell^{*}\right)<u^{i}(\ell(i))$ for each $i=k+$ $1, \ldots, m$. Let $L:=\ell^{*} \cup\{\ell(i): i=k+1, \ldots, m\}$. Since each utility is nonconstant, up to perturbing lotteries in $L$, we can assume without loss that $\left|M\left(L, u^{i}\right)\right|=1$ for each $i=1, \ldots, m$ while preserving the above strict inequalities. This completes the proof as $M\left(L, u^{j}\right)=\left\{\ell^{*}\right\}$ for each $j=1, \ldots, k$ and $M\left(L, u^{i}\right) \neq\left\{\ell^{*}\right\}$ for each $i=k+1, \ldots, m$. Q.E.D.

## H.1. Proof of Proposition 4

"If" direction: Consider any $L_{0} \in \mathcal{L}_{0}^{*}, L_{1} \in \mathcal{A}_{1}^{*}$ with $L_{1} \subseteq L_{0}$ such that $\rho_{0}^{Z}\left(\ell ; L_{0}\right)$, $\rho_{0}^{Z}\left(\ell^{\prime} ; L_{0}\right)>0$.

Let $\mathcal{U}_{0}(\ell):=\left\{u_{0}(\omega): \omega \in C\left(L_{0}, \ell\right)\right\}$ and $\mathcal{U}_{0}\left(\ell^{\prime}\right):=\left\{u_{0}(\omega): \omega \in C\left(L_{0}, \ell^{\prime}\right)\right\}$. Note that since $L_{1}$ features no ties, Lemma E. 3 implies $C\left(L_{1}, \ell\right)=\left\{\omega: \ell \in M\left(L_{1}, u_{1}(\omega)\right)\right\}$ by the representation in the atemporal domain. Hence

$$
\begin{align*}
\rho_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell\right) & =\mu\left(\left\{\ell \in M\left(L_{1}, u_{1}\right)\right\} \mid C\left(L_{0}, \ell\right)\right) \\
& \geq \min _{u \in \mathcal{U}_{0}(\ell)} \mu\left(\left\{p \in M\left(L_{1}, u_{1}\right)\right\} \mid\left\{u_{0} \approx u\right\}\right) . \tag{27}
\end{align*}
$$

Likewise,

$$
\begin{align*}
\rho_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell\right) & =\mu\left(\left\{\ell \in M\left(L_{1}, u_{1}\right)\right\} \mid C\left(L_{0}, \ell^{\prime}\right)\right) \\
& \leq \max _{u^{\prime} \in \mathcal{U}_{0}\left(\ell^{\prime}\right)} \mu\left(\left\{\ell \in M\left(L_{1}, u_{1}\right)\right\} \mid\left\{u_{0} \approx u^{\prime}\right\}\right) . \tag{28}
\end{align*}
$$

Pick $u \in \mathcal{U}_{0}(\ell)$ (respectively, $u^{\prime} \in \mathcal{U}_{0}\left(\ell^{\prime}\right)$ ) which achieve the min (respectively, max) in (27) (respectively, in (28)). Let $\left\{u_{1}^{1}, \ldots, u_{1}^{m}\right\}:=\left\{u_{1}(\omega): \omega \in C\left(L_{0}, \ell\right) \cup C\left(L_{0}, \ell^{\prime}\right)\right.$ and $\ell \in$ $\left.M\left(L_{1}, u_{1}(\omega)\right)\right\}$ and let $D:=\operatorname{co}\left\{u, u_{1}^{1}, \ldots, u_{1}^{m}\right\}$. Note that since $L_{0} \supseteq L_{1}$, we have $\ell \in$ $M\left(L_{1}, u\right)$. Hence, $\left\{\omega: u_{0}(\omega) \approx u, \ell \in M\left(L_{1}, u_{1}(\omega)\right)\right\}=\left\{\omega: u_{0}(\omega) \approx u, u_{1}(\omega) \in[D]\right\}$, and likewise $\left\{\omega: u_{0}(\omega) \approx u^{\prime}, \ell \in M\left(L_{1}, u_{1}(\omega)\right)\right\}=\left\{\omega: u_{0}(\omega) \approx u^{\prime}, u_{1}(\omega) \in[D]\right\}$. Thus,

$$
\begin{align*}
\mu\left(\left\{\ell \in M\left(L_{1}, u_{1}\right)\right\} \mid \cap\left\{u_{0} \approx u\right\}\right) & =\mu\left([D] \mid\left\{u_{0} \approx u\right\}\right) \geq \mu\left([D] \mid\left\{u_{0} \approx u^{\prime}\right\}\right) \\
& =\mu\left(\left\{\ell \in M\left(L_{1}, u_{1}\right)\right\} \mid\left\{u_{0} \approx u^{\prime}\right\}\right) \tag{29}
\end{align*}
$$

where the inequality holds by assumption. Combining (27), (28), and (29) yields $\rho_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell\right) \geq \rho_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell^{\prime}\right)$, as required.
"Only if" direction: We prove the contrapositive. Suppose that for some $u, u^{\prime} \in \mathbb{R}^{Z}$ and convex $D \subseteq \mathbb{R}^{Z}$ with $u \in D$ such that $\mu\left(\left\{u_{0} \approx u\right\}\right), \mu\left(\left\{u_{0} \approx u^{\prime}\right\}\right)>0$, we have

$$
\begin{equation*}
\mu\left(\left\{u_{1} \in[D]\right\} \mid\left\{u_{0} \approx u\right\}\right)<\mu\left(\left\{u_{1} \in[D]\right\} \mid\left\{u_{0} \approx u^{\prime}\right\}\right) \tag{30}
\end{equation*}
$$

Let $\mathcal{U}_{1}$ be the set of possible realizations of $u_{1}$ conditional on the event $\left\{\omega: u_{0} \approx u\right.$ or $u_{0} \approx$ $\left.u^{\prime}\right\}$. Let $\mathcal{U}_{0}$ be the set of possible realizations of $u_{0}$. Enumerate $\left\{u_{1}^{1}, \ldots, u_{1}^{m}\right\}:=\mathcal{U}_{1} \cap[D]$, which is nonempty by (30).

By Condition 1, $u_{t}(\bar{\ell})>u_{t}(\underline{\ell})$ for each $t=1,2$ and any possible realization $u_{t}$. Thus, we can apply Lemma H. 1 so that there exist some menu $L_{1}$ and $\ell^{*}$ such that (i) $M\left(L_{1}, u\right)=$ $M\left(L_{1}, u_{1}^{i}\right)=\left\{\ell^{*}\right\}$ for all $i=1, \ldots, m$, (ii) $\left|M\left(L_{1}, u_{1}\right)\right|=1$ and $M\left(L_{1}, u_{1}\right) \not \supset \ell^{*}$ for each $u_{1} \in \mathcal{U}_{1} \backslash[D]$. Subject to perturbations of the lotteries in $L_{1}$, we can assume without loss that $\left|M\left(L_{1}, u_{t}\right)\right|=1$ for each $t=1,2$ and any possible realization of $u_{t}$ (since every such realization is nonconstant). Thus, $L_{1} \in \mathcal{A}_{1}^{*}$ by Lemma E.3.

By construction of $L_{1}$, we have

$$
\left\{\ell^{*} \in M\left(u_{1}, L_{1}\right)\right\} \cap\left\{u_{0} \approx u\right\}=\left\{u_{1} \in[D]\right\} \cap\left\{u_{0} \approx u\right\} .
$$

Let $\left\{\left[u_{0}^{1}\right], \ldots,\left[u_{0}^{k}\right]\right\}$ denote the collection of equivalence classes of utilities in $\mathcal{U}_{0}$, and assume without loss that $u \in\left[u_{0}^{1}\right]$. By Lemma E.2, we construct a collection of consumption lotteries $\{\ell(h): h=1, \ldots, k\}$ such that $u_{0}(\ell(h))>u_{0}\left(\ell\left(h^{\prime}\right)\right)$ for any distinct $h, h^{\prime}=1, \ldots, k$ with $u_{0} \in\left[u_{0}^{h}\right]$.

Pick $\varepsilon^{\prime}>0$ sufficiently small such that $\ell^{*}+\varepsilon^{\prime}(\ell(h)-\ell(1)) \in \Delta(Z)$ for all $h=2, \ldots, k$; the construction is possible since $\ell^{*}$ is in the interior of $\Delta(Z)$. Define a menu $L_{0}$ by

$$
L_{0}:=L_{1} \cup\left\{\ell^{*}+\varepsilon^{\prime}(\ell(h)-\ell(1)): h=2, \ldots, k\right\} .
$$

For each $h=2, \ldots, k$ and $u_{0} \in\left[u_{0}^{h}\right], u_{0}\left(\ell^{*}+\varepsilon^{\prime}(\ell(h)-\ell(1))\right)$ is nonconstant in $\varepsilon^{\prime}$; therefore, for small enough $\varepsilon^{\prime}>0, M\left(L_{0}, u_{0}\right)$ is either $\left\{\ell^{*}+\varepsilon^{\prime}(\ell(h)-\ell(1))\right\}$ or a singleton included in $L_{1}$. Furthermore, $M\left(L_{0}, u_{0}\right)=\left\{\ell^{*}\right\}$ for each $u_{0} \in\left[u_{0}^{1}\right]$. This ensures that $L_{0} \in \mathcal{L}_{0}^{*}$ by Lemma E.3. Furthermore,

$$
\left\{\ell^{*} \in M\left(u_{0}, L_{0}\right)\right\}=\left\{u_{0} \approx u\right\}
$$

Since $u \not \nsim u^{\prime}$, there is a lottery $\ell_{0} \in L_{0}$ different from $\ell^{*}$ such that $M\left(L_{0}, u^{\prime}\right)=\left\{\ell_{0}\right\}$.

By the previous observations, we have $L_{0} \supseteq L_{1}$ and $\rho_{1}^{Z}\left(\ell^{*} ; L_{1} \mid L_{0}, \ell^{*}\right)=\mu\left(u_{1} \in\right.$ $\left.[D] \mid u_{0} \approx u\right)$ and $\rho_{1}^{Z}\left(\ell^{*} ; L_{1} \mid L_{0}, \ell_{0}\right)=\mu\left(u_{1} \in[D] \mid u_{0} \approx u^{\prime}\right)$. But then (30) implies that $\rho_{1}^{Z}\left(\ell^{*} ; L_{1} \mid L_{0}, \ell_{0}\right)<\rho_{1}^{Z}\left(\ell^{*} ; L_{1} \mid L_{0}, \ell_{0}\right)$, which is a violation of consumption persistence.

## H.2. Proof of Proposition 5

For each menu $L$ of consumption lotteries and $\ell \in L$, recall the notation $N(L, \ell)=$ $\left\{u \in \mathbb{R}^{Z}: u \cdot \ell \geq u \cdot \ell^{\prime}, \forall \ell^{\prime} \in L\right\}$. Note that $N(L, \ell)$ is convex with $N(L, \ell)=[N(L, \ell)]$.
"If" direction: $\rho_{0}^{Z}=\hat{\rho}_{0}^{Z}$ follows directly from the condition that $\mu\left(\left\{u_{0} \approx u\right\}\right)=\hat{\mu}\left(\left\{\hat{u}_{0} \approx\right.\right.$ $u\}$ ) for each $u \in \mathbb{R}^{Z}$.

Take any $L_{0} \in \mathcal{L}_{0}^{*}, L_{1} \in \mathcal{A}_{1}^{*}$, and $\ell \in L_{0}$ such that $L_{0} \supseteq L_{1}$. Let $\left\{\left[u_{0}^{1}\right], \ldots,\left[u_{0}^{k}\right]\right\}$ denote the set of possible consumption preferences in period 0 that can realize with positive probabilities under $\mu$ or $\hat{\mu}$ and belong to $\left[N\left(L_{0}, \ell\right)\right]$. Since there is no tie in $L_{0}$ and $L_{1}$, we can write

$$
\begin{aligned}
\rho_{1}^{Z}\left(\ell, L_{1} \mid L_{0}, \ell\right) & =\frac{\sum_{i=1}^{k} \mu\left(\left\{u_{0} \approx u_{0}^{i}\right\}\right) \mu\left(\left\{u_{1} \in N\left(L_{1}, \ell\right)\right\} \mid\left\{u_{0} \approx u_{0}^{i}\right\}\right)}{\sum_{i=1}^{k} \mu\left(\left\{u_{0} \approx u_{0}^{i}\right\}\right)} \\
& \geq \frac{\sum_{i=1}^{k} \hat{\mu}\left(\left\{\hat{u}_{0} \approx u_{0}^{i}\right\}\right) \mu\left(\left\{\hat{u}_{1} \in N\left(L_{1}, \ell\right)\right\} \mid\left\{\hat{u}_{0} \approx u_{0}^{i}\right\}\right)}{\sum_{i=1}^{k} \hat{\mu}\left(\left\{\hat{u}_{0} \approx u_{0}^{i}\right\}\right)}=\hat{\rho}_{1}^{Z}\left(\ell, L_{1} \mid L_{0}, \ell\right)
\end{aligned}
$$

where the inequality follows from the condition that $\mu\left(\left\{u_{0} \approx u_{0}^{i}\right\}\right)=\hat{\mu}\left(\left\{\hat{u}_{0} \approx u_{0}^{i}\right\}\right)$ and $\mu\left(\left\{u_{1} \in N\left(L_{1}, \ell\right)\right\} \mid\left\{u_{0} \approx u_{0}^{i}\right\}\right) \geq \mu\left(\left\{\hat{u}_{1} \in N\left(L_{1}, \ell\right)\right\} \mid\left\{\hat{u}_{0} \approx u_{0}^{i}\right\}\right)$ for each $i=1, \ldots, k$.
"Only if" direction: For each $u \in \mathbb{R}^{Z}, \mu\left(\left\{u_{0} \approx u\right\}\right)=\hat{\mu}\left(\left\{u_{0} \approx \hat{u}\right\}\right)$ follows directly from $\rho_{0}^{Z}=\hat{\rho}_{0}^{Z}$. To complete the remaining part, we suppose to the contrary that there exist $u \in \mathbb{R}^{Z}$ and a convex set $D \ni u$ such that $\mu\left(\left\{u_{1} \in[D]\right\} \mid\left\{u_{0} \approx u\right\}\right)<\hat{\mu}\left(\left\{\hat{u}_{1} \in[D]\right\} \mid\left\{\hat{u}_{0} \approx u\right\}\right)$.

Let $\left\{\left[u_{0}^{1}\right], \ldots,\left[u_{0}^{k}\right]\right\}$ and $\left\{\left[u_{1}^{1}\right], \ldots,\left[u_{1}^{m}\right]\right\}$ denote the set of possible consumption preferences that can realize with positive probabilities under $\mu$ or $\hat{\mu}$ in periods 0 and 1 , respectively. Note that by the joint uniformly ranked pair condition, $u_{1}^{i}(\bar{\ell})>u_{1}^{i}(\underline{\ell})$ for each $i=1, \ldots, m$. Thus, by Lemma H.1, there exist a lottery $\ell^{*}$ and a menu $L_{1}$ such that (i) $M\left(L_{1}, u\right)=M\left(L_{1}, u_{1}^{i}\right)=\left\{\ell^{*}\right\}$ for each $i=1, \ldots, m$ with $u_{1}^{i} \in[D]$, and (ii) $M\left(L_{1}, u_{1}^{i}\right) \nexists \ell^{*}$ and $\left|M\left(L_{1}, u_{1}^{i}\right)\right|=1$ for each $i=1, \ldots, m$ with $u_{1}^{i} \notin[D]$. Thus, $L_{1} \in \mathcal{A}_{1}^{*}$.

Moreover, following the same construction as in the proof of Proposition 4, we construct a menu $L_{0} \supseteq L_{1}$ such that (i) $M\left(L_{0}, u\right)=\left\{\ell^{*}\right\}$ and (ii) $M\left(L_{0}, u_{0}^{i}\right) \not \supset \ell^{*}$ and $\left|M\left(L_{0}, u_{0}^{i}\right)\right|=1$ for each $i=1, \ldots, k$ with $u_{0}^{i} \notin[u]$. Thus, $L_{0} \in \mathcal{L}_{0}^{*}$.

Based on this, we can write the choice probabilities as

$$
\begin{aligned}
\rho_{1}^{Z}\left(\ell^{*}, L_{1} \mid L_{0}, \ell^{*}\right) & =\mu\left(\left\{u_{1} \in\left\{\left[u_{1}^{1}\right], \ldots,\left[u_{1}^{k}\right]\right\} \cap[D]\right\} \mid\left\{u_{0} \approx u\right\}\right) \\
& <\hat{\mu}\left(\left\{\hat{u}_{1} \in\left\{\left[u_{1}^{1}\right], \ldots,\left[u_{1}^{k}\right]\right\} \cap[D]\right\} \mid\left\{\hat{u}_{0} \approx u\right\}\right)=\hat{\rho}_{1}^{Z}\left(\ell^{*}, L_{1} \mid L_{0}, \ell^{*}\right)
\end{aligned}
$$

which contradicts the fact that $\rho^{Z}$ features more consumption persistence than $\hat{\rho}^{Z}$.

## H.3. Proof of Corollary 1

## (i) $\Longrightarrow$ (ii):

We consider the case $m \geq 2$ as otherwise the desired statement trivially holds with any $\alpha$. Observe first that for any distinct indices $i, j \in\{1, \ldots, m\}$, consumption persistence and its characterization (Proposition 4) imply

$$
\begin{equation*}
M_{i i}=\mu\left(\left\{u_{1} \in\left[u^{i}\right]\right\} \mid u_{0}=u^{i}\right) \geq \mu\left(\left\{u_{1} \in\left[u^{i}\right]\right\} \mid u_{0}=u^{j}\right)=M_{j i} \tag{31}
\end{equation*}
$$

by taking $D=\left\{u^{i}\right\}$. (Note that, by definition, both $u^{i}$ and $u^{j}$ arise with positive probability in period 0 .) Moreover, if $D=\operatorname{co}\left\{u^{i}, u^{j}\right\}$, then by the non-collinearity assumption, there is no $k \notin\{i, j\}$ such that $u^{k} \in[D]$. Thus, by consumption persistence and its characterization (Proposition 4),

$$
\begin{equation*}
M_{i i}+M_{i j}=\mu\left(\left\{u_{1} \in[D]\right\} \mid u_{0}=u^{i}\right)=\mu\left(\left\{u_{1} \in[D]\right\} \mid u_{0}=u^{j}\right)=M_{j j}+M_{j i} . \tag{32}
\end{equation*}
$$

Suppose first that $m=2$. Since $1=M_{11}+M_{12}=M_{22}+M_{21}$, we have $M_{11}-M_{21}=M_{22}-$ $M_{12}:=\alpha$, which is nonnegative by (31). Since the Markov chain is irreducible, $M_{21}, M_{12}>$ 0 , which also ensures $\alpha<1$. One can verify the desired form by setting $\nu\left(u^{1}\right)=\frac{M_{21}}{1-\alpha}$ and $\nu\left(u^{2}\right)=\frac{M_{12}}{1-\alpha}$.

Suppose next that $m \geq 3$. Take any distinct $i, j, k \in\{1, \ldots, m\}$ and let $D^{\prime}=\operatorname{co}\left\{u^{i}, u^{j}, u^{k}\right\}$. By non-collinearity, there is no $l \notin\{i, j, k\}$ such that $u^{l} \in\left[D^{\prime}\right]$. Thus, by consumption persistence and its characterization (Proposition 4),

$$
M_{i i}+M_{i j}+M_{i k}=\mu\left(\left\{u_{1} \in\left[D^{\prime}\right]\right\} \mid u_{0}=u^{i}\right)=\mu\left(\left\{u_{1} \in\left[D^{\prime}\right]\right\} \mid u_{0}=u^{j}\right)=M_{j j}+M_{j i}+M_{j k} .
$$

Combined with (32), this implies that $M_{i k}=M_{j k}$ for any distinct $i, j, k$. Thus, for any $k$, we can define $\beta_{k}:=M_{i k}$ for some arbitrary $i \neq k$. Here $\beta_{k}>0$, because otherwise $\sum_{i \text { s.t. } i \neq k} M_{i k}=0$, contradicting irreducibility of the Markov chain. By (32), $M_{i i}-M_{j i}=$ $M_{i j}-M_{i j}$ for any $i, j$, and thus $M_{i i}-\beta_{i}=M_{j j}-\beta_{j}=: \alpha$ for any $i, j$. By (31), $\alpha \geq 0$, and $\alpha<1$ as $\beta_{k}>0$ for all $k$. Thus, setting $\nu\left(u^{j}\right)=\frac{\beta_{j}}{1-\alpha}$ for each $j$ yields to the desired form.
(ii) $\Longrightarrow$ (i):

Take any pair $u, u^{\prime} \in \mathbb{R}^{Z}$ of possible realizations of period-0 felicities. Then, for any convex set $D \subseteq \mathbb{R}^{Z}$ with $u \in D$, by (ii) we have

$$
\begin{aligned}
\mu\left(\left\{u_{1} \in[D]\right\} \mid u_{0} \approx u\right) & =\alpha+(1-\alpha) \sum_{u^{j} \in[D]} \nu\left(u^{j}\right) \geq \alpha I_{u^{\prime} \in[D]}+(1-\alpha) \sum_{u^{j} \in[D]} \nu\left(u^{j}\right) \\
& =\mu\left(\left\{u_{1} \in[D]\right\} \mid u_{0} \approx u^{\prime}\right) .
\end{aligned}
$$

Thus, $\rho$ features consumption persistence by Proposition 4.
(ii) $\Longrightarrow$ (iii):

Note that for any $L=\left\{\ell^{1}, \ldots, \ell^{m}\right\} \in \mathcal{L}_{0}^{*}$ and distinct indices $i$, $j$, we have $\rho_{1}^{Z}\left(\ell^{i} ; L \mid\right.$ $\left.L, \ell^{i}\right)=\alpha+(1-\alpha) \sum_{u^{k} \in N\left(L, \ell^{i}\right)} \nu\left(u^{k}\right)=\alpha+(1-\alpha) \rho_{0}^{Z}\left(\ell^{i} ; L\right)$ and $\rho_{1}^{Z}\left(\ell^{j} ; L \mid L, \ell^{i}\right)=(1-$ $\alpha) \sum_{u^{k} \in N\left(L, \ell^{j}\right)} \nu\left(u^{k}\right)=(1-\alpha) \rho_{0}^{Z}\left(\ell^{j} ; L\right)$.
(iii) $\Longrightarrow$ (ii):

Since $\left\{u^{1}, \ldots, u^{m}\right\}$ are ordinally distinct, Lemma E. 2 yields $L=\left\{\ell^{1}, \ldots, \ell^{m}\right\}$ such that $M\left(L, u^{i}\right)=\left\{\ell^{i}\right\}$ for each $i$. Then, by the Markov representation, we have $\rho_{1}^{Z}\left(\ell^{j} ; L \mid L, \ell^{i}\right)=$ $M_{i j}$ and $\rho_{0}^{Z}\left(\ell^{i} ; L\right)=\nu\left(u^{i}\right)$ for all indices $i, j$. Thus, by (iii), there exists $\beta \in[0,1)$ such that $M_{i i}=\beta+(1-\beta) \nu\left(u^{i}\right)$ and $M_{i j}=(1-\beta) \nu\left(u^{j}\right)$ for all $i \neq j$, which verifies (ii).

## H.4. Proof of Corollary 2

Since $\rho$ and $\hat{\rho}$ admit sticky i.i.d. representations, for each $\ell \in L_{1} \subseteq L_{0}$ with $L_{0} \in \mathcal{L}_{0}^{*}$ and $L_{1} \in \mathcal{A}_{1}^{*}$, choice probabilities satisfy

$$
\begin{aligned}
\rho_{0}^{Z}\left(\ell ; L_{0}\right) & =\sum_{u^{i} \in N\left(L_{0}, \ell\right)} \nu\left(u^{i}\right), \quad \hat{\rho}_{0}^{Z}\left(\ell ; L_{0}\right)=\sum_{u^{i} \in N\left(L_{0}, \ell\right)} \hat{\nu}\left(u^{i}\right), \\
\rho_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell\right) & =\alpha+(1-\alpha) \sum_{u^{i} \in N\left(L_{1}, \ell\right)} \nu\left(u^{i}\right), \\
\hat{\rho}_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell\right) & =\hat{\alpha}+(1-\hat{\alpha}) \sum_{u^{i} \in N\left(L_{1}, \ell\right)} \hat{\nu}\left(u^{i}\right) .
\end{aligned}
$$

The "if" direction is immediate from these expressions. For the "only if" direction, the existence of the bijection $\phi$ follows from the fact that $\rho^{Z}$ and $\hat{\rho}^{Z}$ coincide on period- 0 consumption choices and the assumption that, in each representation, all felicities are ordinally distinct. To show that $\alpha \geq \hat{\alpha}$, consider any $\ell \in L_{1} \subseteq L_{0}$ (with $L_{0} \in \mathcal{L}_{0}^{*}$ and $L_{1} \in \mathcal{A}_{1}^{*}$ ) such that $\sum_{u^{i} \in N\left(L_{1}, \ell\right)} \nu\left(u^{i}\right)=\sum_{u^{i} \in N\left(L_{1}, \ell\right)} \hat{\nu}\left(u^{i}\right)<1$. Then $\rho_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell\right) \geq \hat{\rho}_{1}^{Z}\left(\ell ; L_{1} \mid L_{0}, \ell\right)$ implies $\alpha \geq \hat{\alpha}$.

## H.5. Proof of Proposition 6

## Necessity:

Take any $L \in \mathcal{L}_{0}^{*}$ and $\ell, \ell^{\prime} \in L$ with $\left\{\ell, \ell^{\prime}\right\} \in \mathcal{A}_{1}^{*}$. If $\rho_{0}^{Z}(\ell ; L)>0$, then there exists $u \in N(L, \ell)$ such that $\mu\left(\left\{u_{0}=u\right\}\right)>0$. This implies $u(\ell)>u\left(\ell^{\prime}\right)$. Then by (2), there exists some $u^{\prime} \in \mathbb{R}^{Z}$ with $\mu\left(\left\{u_{1}=u^{\prime}\right\} \mid\left\{u_{0}=u\right\}\right)>0$ such that $u^{\prime}(\ell)>u^{\prime}\left(\ell^{\prime}\right)$. This ensures $\rho_{1}^{Z}\left(\ell ;\left\{\ell, \ell^{\prime}\right\} \mid L, \ell\right)>0$ because $\mu\left(\left\{u_{1} \approx u^{\prime}\right\} \mid\left\{u_{0} \in N(L, \ell)\right\}\right)>0$.

Sufficiency:
Take a BEU representation $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}, u_{t}, \delta_{t}, W_{t}\right)\right)$ of $\rho^{Z}$. Let $\hat{\mathcal{F}}_{0}$ be the sigmaalgebra generated by the random equivalence class $\left[u_{0}\right]$, that is, $\hat{\mathcal{F}}_{0}$ is induced by the finest partition over $\Omega$ such that $u_{0}(\cdot)$ corresponds to the same preference within each cell. Likewise, let $\hat{\mathcal{F}}_{1}$ be the sigma-algebra generated by the random sequence of equivalence classes $\left(\left[u_{0}\right],\left[u_{1}\right]\right)$. Note that $\hat{\mathcal{F}}_{0} \subseteq \mathcal{F}_{0}$ and $\hat{\mathcal{F}}_{1} \subseteq \mathcal{F}_{1}$. For each $t=0$, 1 , construct an $\hat{\mathcal{F}}_{t^{-}}$ measurable function $\hat{u}_{t}$ such that $\hat{u}_{t}(\omega) \approx u_{t}(\omega)$ and $\sum_{z} \hat{u}_{t}(\omega)(z)=0$ for each $\omega$.

We consider a tuple $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}, \hat{u}_{t}, \delta_{t}, \hat{W}_{t}\right)\right)$, where $\left(\hat{U}_{t}\right)$ is induced from ( $\mu,\left(\hat{\mathcal{F}}_{t}, \hat{u}_{t}, \delta_{t}\right)$ ) by equation (1), and $\left(\hat{W}_{t}\right)$ is any $\mathcal{F}^{*}$-measurable tie-breaker that satisfies the properness condition with respect to $\left(\mu,\left(\hat{\mathcal{F}}_{t}\right)\right)$. This tuple is clearly a BEU representation of $\rho^{Z}$, since $\left(u_{t}\right)$ and $\left(\hat{u}_{t}\right)$ are ordinally equivalent at every state. ${ }^{84}$

Next, we fix any $\hat{u} \in \mathbb{R}^{Z}$ such that $\mu\left(\left\{\hat{u}_{0}=\hat{u}\right\}\right)>0$, and let $\mathcal{U}_{\hat{u}}:=\left\{\hat{u}^{\prime} \in \mathbb{R}^{Z}: \mu\left(\left\{\hat{u}_{1}=\right.\right.\right.$ $\left.\left.\left.\hat{u}^{\prime}\right\} \mid\left\{\hat{u}_{0}=\hat{u}\right\}\right)>0\right\}$. We now use Axiom 11 (consumption inertia) to show that $\hat{u} \in \operatorname{co} \mathcal{U}_{\hat{u}}$. By the affine aggregation theorem (e.g., Theorem 2 in Fishburn (1984)), it suffices to establish that for all $\ell, \ell^{\prime} \in \Delta(Z)$, we have

$$
\left[\hat{u}^{\prime}\left(\ell^{\prime}\right) \geq \hat{u}^{\prime}(\ell), \forall \hat{u}^{\prime} \in \mathcal{U}_{\hat{u}}\right] \quad \Rightarrow \quad \hat{u}\left(\ell^{\prime}\right) \geq \hat{u}(\ell)
$$

[^2]Suppose to the contrary that $\left[\hat{u}^{\prime}\left(\ell^{\prime}\right) \geq \hat{u}^{\prime}(\ell), \forall \hat{u}^{\prime} \in \mathcal{U}_{\hat{u}}\right]$ and $\hat{u}\left(\ell^{\prime}\right)<\hat{u}(\ell)$ for some $\ell, \ell^{\prime}$. By the Uniformly Ranked Pair condition, we have $\hat{u}^{\prime}(\bar{\ell})>\hat{u}^{\prime}(\underline{\ell})$ for all $\hat{u}^{\prime} \in \mathcal{U}_{\hat{u}}$. Thus, by mixing $\bar{\ell}$ with $\ell^{\prime}$ (resp. $\underline{\ell}$ with $\ell$ ) with a small weight on $\bar{\ell}$ (resp. $\underline{\ell}$ ), we can assume without loss that $\left[\hat{u}^{\prime}\left(\ell^{\prime}\right)>\hat{u}^{\prime}(\ell), \forall \hat{u}^{\prime} \in \mathcal{U}_{\hat{u}}\right]$ and $\hat{u}(\ell)>\hat{u}\left(\ell^{\prime}\right)$. In addition, since the relevant inequalities are all strict, we can assume that $\ell, \ell^{\prime} \in \operatorname{int} \Delta(Z)$ and $\left\{\ell, \ell^{\prime}\right\} \in \mathcal{A}_{1}^{*}$. Take a menu of consumption lotteries $L \in \mathcal{L}_{0}^{*}$ such that $\ell, \ell^{\prime} \in L, M(L, \hat{u})=\{\ell\}$, and $M\left(L, \hat{u}^{\prime \prime}\right) \not \supset \ell$ for all other period- 0 felicities $\hat{u}^{\prime \prime} \neq \hat{u}$ that can realize with positive probability under $\mu .{ }^{85}$ For this menu $L$, it follows that $\rho_{0}^{Z}(\ell ; L)=\mu\left(\left\{\hat{u}_{0}=\hat{u}\right\}\right)>0$ and $\rho_{1}^{Z}\left(\ell ;\left\{\ell, \ell^{\prime}\right\} \mid L, \ell\right)=\mu\left(\left\{\hat{u}_{1}(\ell)>\hat{u}_{1}\left(\ell^{\prime}\right)\right\} \mid\left\{\hat{u}_{0}=u\right\}\right)=0$, contradicting consumption inertia.

The observation in the previous paragraph implies that for each $\hat{u} \in \mathbb{R}^{Z}$ such that $\mu\left(\left\{\hat{u}_{0}=\hat{u}\right\}\right)>0$, there exist constants $\left(\alpha_{\hat{u}, \hat{u}^{\prime}}\right)_{\hat{u}^{\prime} \in u_{\hat{u}}} \geq 0$ and $\beta_{\hat{u}} \in \mathbb{R}$ such that

$$
\begin{equation*}
\hat{u}=\sum_{\hat{u}^{\prime} \in \mathcal{U}_{\hat{u}}} \alpha_{\hat{u}, \hat{u}^{\prime}} \hat{u}^{\prime}+\beta_{\hat{u}} . \tag{33}
\end{equation*}
$$

Since, by construction, $\sum_{z} \hat{u}_{t}(\omega)(z)=0$ at every state $\omega$ and period $t$, we must have $\beta_{\hat{u}}=0$.

Define $\hat{u}_{0}^{\prime}(\omega):=\hat{u}_{0}(\omega)$ and $\hat{u}_{1}^{\prime}(\omega):=\frac{\alpha_{\hat{u}_{0}(\omega), \hat{u}_{1}(\omega)}}{\mu\left(E_{1}(\omega) \mid E_{0}(\omega)\right)} \hat{u}_{1}(\omega)$ for each $\omega$, where $E_{t}(\cdot)$ denotes each cell of the partition that generates $\hat{\mathcal{F}}_{t}$ for $t=1,2$. Note that each $\hat{u}_{t}^{\prime}$ is $\hat{\mathcal{F}}_{t^{-}}$ measurable. We consider the tuple $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}^{\prime}, \hat{u}_{t}^{\prime}, \delta_{t}, \hat{W}_{t}\right)\right.$ ), where $\left(\hat{U}_{t}^{\prime}\right)$ is induced from $\left(\mu,\left(\hat{\mathcal{F}}_{t}, \hat{u}_{t}^{\prime}, \delta_{t}\right)\right)$ by equation (1). This tuple is still a BEU representation of $\rho^{Z}$, since $\left(\hat{u}_{t}^{\prime}\right)$ and $\left(\hat{u}_{t}\right)$ are ordinally equivalent at every state.

To conclude that the representation is BEB, we verify that (2) holds with $\tilde{u}:=\hat{u}_{1}^{\prime}$. That is, for each $\omega$,

$$
\mathbb{E}\left[\hat{u}_{1}^{\prime} \mid \hat{\mathcal{F}}_{0}(\omega)\right]=\sum_{E_{1} \subseteq E_{0}(\omega)} \mu\left(E_{1} \mid E_{0}(\omega)\right) \hat{u}_{1}^{\prime}\left(E_{1}\right)=\sum_{E_{1} \subseteq E_{0}(\omega)} \alpha_{\hat{u}_{0}(\omega), \hat{u}_{1}\left(E_{1}\right)} \hat{u}_{1}\left(E_{1}\right)=\hat{u}_{0}(\omega)=\hat{u}_{0}^{\prime}(\omega),
$$

where the second and fourth equalities hold by definition of $\hat{u}_{t}^{\prime}$ and the third equality uses (33) with $\beta_{\hat{u}_{0}(\omega)}=0$ for each $\omega$.

## APPENDIX I: ADditional Results

## I.1. Identification

The following proposition provides identification results for our representations (see Remark 1 for the discussion).

Proposition I.1: Suppose $\rho$ and $\hat{\rho}$ admit DREU representations $\mathcal{D}=\left(\Omega, \mathcal{F}^{*}, \mu\right.$, $\left.\left(\mathcal{F}_{t}, U_{t}, W_{t}\right)\right)$ and $\hat{\mathcal{D}}=\left(\hat{\Omega}, \hat{\mathcal{F}}^{*}, \hat{\mu},\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}, \hat{W}_{t}\right)\right)$, with partitions $\Pi_{t}$ and $\hat{\Pi}_{t}$ generating $\mathcal{F}_{t}$

[^3]and $\hat{\mathcal{F}}_{t}$, respectively. Then $\rho=\hat{\rho}$ if and only if, for each $t$, there exists a bijection $\phi_{t}: \Pi_{t} \rightarrow \hat{\Pi}_{t}$ and $\mathcal{F}_{t}$-measurable functions $\alpha_{t}: \Omega \rightarrow \mathbb{R}_{++}$and $\beta_{t}: \Omega \rightarrow \mathbb{R}$ such that, for all $\omega \in \Omega$,
(i) $\mu\left(\mathcal{F}_{0}(\omega)\right)=\hat{\mu}\left(\phi_{0}\left(\mathcal{F}_{0}(\omega)\right)\right)$ and $\mu\left(\mathcal{F}_{t}(\omega) \mid \mathcal{F}_{t-1}(\omega)\right)=\hat{\mu}\left(\phi_{t}\left(\mathcal{F}_{t}(\omega)\right) \mid\right.$ $\left.\phi_{t-1}\left(\mathcal{F}_{t-1}(\omega)\right)\right)$ if $t \geq 1$;
(ii) $U_{t}(\omega)=\alpha_{t}(\omega) \hat{U}_{t}(\hat{\omega})+\beta_{t}(\omega)$ whenever $\hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$;
(iii) $\mu\left[\left\{W_{t} \in B_{t}(\omega)\right\} \mid \mathcal{F}_{t}(\omega)\right]=\hat{\mu}\left[\left\{\hat{W}_{t} \in B_{t}(\omega)\right\} \mid \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)\right]$ for any $B_{t}(\omega)$ such that $B_{t}(\omega)=\left\{w \in \mathbb{R}^{X}: p_{t} \in M\left(M\left(A_{t}, U_{t}(\omega)\right), w\right)\right\}$ for some $p_{t} \in A_{t} \in \mathcal{A}_{t}$.
If $\left(\mathcal{D},\left(u_{t}, \delta_{t}\right)\right)$ is a BEU representation of $\rho$, then $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ is a BEU representation of $\rho$ if and only if (i)-(iii) hold and additionally, for all $t=0, \ldots, T$,
(iv) $\alpha_{t}(\omega)=\alpha_{0}(\omega) \prod_{\tau=0}^{t-1} \frac{\hat{\delta}_{\tau}(\hat{\omega})}{\delta_{\tau}(\omega)}$ whenever $\hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$;
(v) $u_{t}(\omega)=\alpha_{t}(\omega) \hat{u}_{t}(\hat{\omega})+\gamma_{t}(\omega)$ whenever $\hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$, where $\gamma_{T}(\omega):=\beta_{T}(\omega)$ and $\gamma_{t}(\omega):=\beta_{t}(\omega)-\delta_{t}(\omega) \mathbb{E}_{\mu}\left[\beta_{t+1} \mid \mathcal{F}_{t}(\omega)\right]$ if $t \leq T-1$.
If $\left(\mathcal{D},\left(u_{t}, \delta_{t}\right)\right)$ is a BEB representation of $\rho$ that satisfies Condition D.1, then $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ is a $B E B$ representation of $\rho$ if and only if (i)-(v) hold and additionally, for all $t=$ $0, \ldots, T-1$,
(vi) $\delta_{t}(\omega)=\hat{\delta}_{t}(\hat{\omega})$ for all $\hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$;
(vii) $\gamma_{t}(\omega)=\mathbb{E}_{\mu}\left[\beta_{T} \mid \mathcal{F}_{t}(\omega)\right]$ for all $\omega$.

Proof: See Appendix J.3.
Q.E.D.

## I.2. Markov Evolving Utility

Definition 14: A (stationary) Markov evolving utility representation is a BEU representation $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}, W_{t}, u_{t}, \delta_{t}\right)\right)$ for which there exists a finite set of felicities $\mathcal{U}=\left\{u^{1}, u^{2}, \ldots, u^{m}\right\} \subseteq \mathbb{R}^{Z}$, with $u^{i} \not \approx u^{j}$ for all $i \neq j$, along with a stationary distribution $\xi \in \Delta^{\circ}(\mathcal{U})$ and a right stochastic transition matrix $\Pi=\left(\Pi_{i, j}\right)_{i, j=1, \ldots, m}$ such that
(i) $\mu\left(u_{t}(\omega) \approx u^{i}\right)=\xi\left(u^{i}\right)$ for all $t=0, \ldots, T$ and $i=1, \ldots, m$;
(ii) $\mu\left(u_{t+1}(\omega) \approx u_{t+1} \mid u_{0}(\omega) \approx u_{0}, \ldots, u_{t-1}(\omega) \approx u_{t-1}, u_{t}(\omega) \approx u_{t}\right)=\mu\left(u_{t+1}(\omega) \approx\right.$ $\left.u_{t+1} \mid u_{t}(\omega) \approx u_{t}\right)$ for all $t=0, \ldots, T-1$ and $u_{0}, \ldots, u_{t+1} \in \mathcal{U}$;
(iii) $\mu\left(u_{t+1}(\omega) \approx u^{j} \mid u_{t}(\omega) \approx u^{i}\right)=\Pi_{i, j}$ for all $t=0,1, \ldots, T-1$ and $i, j=1, \ldots, m$.

We assume that $\rho$ admits a BEU representation. As in Section 6, we consider the restriction $\rho^{Z}$ of $\rho$ to atemporal consumption problems without ties; this is well-defined given the assumption that $\rho$ admits a BEU representation. For each $\ell_{T-1} \in \Delta(Z)$ and $L_{T-1}, L_{T} \in \mathcal{K}(\Delta(Z))$, we define the lottery ( $\left.\ell_{T-1}, L_{T}\right):=\left(\delta_{\ell_{T-1}}, \delta_{L_{T}}\right)$ and menu $\left(L_{T-1}, L_{T}\right):=\left\{\left(\ell_{T-1}^{\prime}, L_{T}\right): \ell_{T-1}^{\prime} \in L_{T-1}\right\}$. Recursively, for each $t \leq T-2, \ell_{t} \in \Delta(Z)$, and $L_{t}, \ldots, L_{T-1} \in \mathcal{K}(\Delta(Z))$, we define the lottery $\left(\ell_{t}, L_{T-1}, \ldots, L_{T}\right):=\left(\delta_{\ell_{t}}, \delta_{\left(L_{t+1}, \ldots, L_{T}\right)}\right)$ and menu $\left(L_{t}, \ldots, L_{T}\right):=\left\{\left(\ell_{t}^{\prime}, L_{t+1}, \ldots, L_{T}\right): \ell_{t}^{\prime} \in L_{t}\right\}$.

Let $\mathcal{L}_{0}^{*} \subseteq \mathcal{K}(\Delta(Z))$ denote the set of period-0 consumption menus without ties, which consists of all $L_{0}$ such that $\left(L_{0}, L_{1}\right) \in \mathcal{A}_{0}^{*}$ for all $L_{1} \in \mathcal{K}(\Delta(Z))$. For any $L_{0} \in \mathcal{L}_{0}^{*}$ and $\ell_{0} \in L_{0}$, define $\rho_{0}^{Z}\left(\ell_{0} ; L_{0}\right):=\rho_{0}\left(\left(\ell_{0}, L_{1}\right) ;\left(L_{0}, L_{1}\right)\right)$ for an arbitrary choice of $L_{1}$. This induces the set of all period-0 consumption histories without ties, that is, sequences $h_{Z}^{0}=\left(L_{0}, \ell_{0}\right)$ such that $\rho_{0}^{Z}\left(\ell_{0}, L_{0}\right)>0$ and $L_{0} \in \mathcal{L}_{0}^{*}$. Recursively, for each period- $t-1$ consumption history without ties $h_{Z}^{t-1}=\left(L_{0}, \ell_{0}, \ldots, L_{t-1}, \ell_{t-1}\right)$, we denote by $\mathcal{L}_{t}^{*}\left(h_{Z}^{t-1}\right)$ the set of period- $t$ consumption menus without ties conditional on $h_{Z}^{t-1}$, which consists of all $L_{t}$ such that $\left(L_{t}, L_{t+1}, . ., L_{T}\right) \in \mathcal{A}_{t}^{*}\left(h^{t-1}\right)$ for all $L_{t+1}, . ., L_{T}$, where $h^{t-1}=\left(A_{0}, p_{0}, \ldots, A_{t-1}, p_{t-1}\right)$ is given by $A_{\tau}=\left(L_{\tau}, L_{\tau+1}, \ldots, L_{T}\right)$ and $p_{\tau}=$ $\left(\ell_{\tau}, L_{\tau+1}, \ldots, L_{T}\right)$ for each $\tau=0, \ldots, t-1$. Given any such $h_{Z}^{t-1}$ and $h^{t-1}$, we define
$\rho_{t}^{Z}\left(\ell_{t}, L_{t} \mid h_{Z}^{t-1}\right):=\rho_{t}\left(\left(\ell_{t}, L_{t+1}, \ldots, L_{T}\right),\left(L_{t}, \ldots, L_{T}\right) \mid h^{t-1}\right)$ for each $L_{t}^{*} \in \mathcal{L}_{t}\left(h_{Z}^{t-1}\right)$ and $\ell_{t} \in L_{t}$; if $\rho_{t}^{Z}\left(\ell_{t}, L_{t} \mid h_{Z}^{t-1}\right)>0$, then we say that the sequence $\left(L_{0}, \ell_{0}, \ldots, L_{t}, \ell_{t}\right)$ is a consumption history without ties in period $t$. Finally, we say that a consumption history without ties is degenerate if the corresponding $L_{\tau}$ 's are all singleton.

AxIOM I.1—Unconditional Stationarity: For all degenerate consumption histories $d_{Z}^{t-1}$, $L \in \mathcal{L}_{t}^{*}\left(d_{Z}^{t-1}\right) \cap \mathcal{L}_{0}^{*}$, and $\ell \in L$, we have $\rho_{0}^{Z}(\ell, L)=\rho_{t}^{Z}\left(\ell, L \mid d_{Z}^{t-1}\right)$.

A consumption atom is a pair $(L, \ell)$ with $L \in \mathcal{L}_{0}^{*}$ and $\ell \in \Delta^{\circ}(Z)$ such that
(i) $\rho_{0}^{Z}(\ell, L)>0$;
(ii) $\rho_{0}^{Z}\left(\ell, L^{\prime}\right) \in\left\{\rho_{0}^{Z}(\ell, L), 0\right\}$ for all $L^{\prime} \in \mathcal{L}_{0}^{*}$ with $L^{\prime} \supseteq L$.

AXIOM I.2-Markov: For any consumption atom $(L, \ell)$ and consumption history $h_{Z}^{t-1}$ without ties, we have $\rho_{1}^{Z}(\cdot \mid L, \ell)=\rho_{t+1}^{Z}\left(\cdot \mid h_{Z}^{t-1}, L, \ell\right)$.

Proposition I.2: Suppose that $\rho$ admits a BEU representation that satisfies Condition D. 1 (Uniformly Ranked Pair). Then $\rho^{Z}$ satisfies Axioms I. 1 and I. 2 if and only if it admits a Markov evolving utility representation.

Proof: See Appendix J.4.
Q.E.D.

## I.3. Approximate Contraction History Independence

Consider the following strengthening of Axiom 1:
Axiom I.3-Approximate Contraction History Independence: If $\left(A_{0}, p_{0}\right),\left(B_{0}, p_{0}\right) \in$ $\mathcal{H}_{0}\left(A_{1}\right)$ and $B_{0} \supseteq A_{0}$, then for all $p_{1} \in A_{1}$,

$$
\left|\rho_{1}\left(p_{1} ; A_{1} \mid A_{0}, p_{0}\right)-\rho_{1}\left(p_{1} ; A_{1} \mid B_{0}, p_{0}\right)\right| \leq 2\left|1-\frac{\rho_{0}\left(p_{0} ; B_{0}\right)}{\rho_{0}\left(p_{0} ; A_{0}\right)}\right| .
$$

Clearly, Axiom I. 3 implies Axiom 1, but it also captures that whenever $\rho_{0}\left(p_{0} ; B_{0}\right)$ and $\rho_{0}\left(p_{0} ; A_{0}\right)$ are close, then period- 1 choice probabilities following $\left(A_{0}, p_{0}\right)$ and $\left(B_{0}, p_{0}\right)$ must be close. The following proposition shows that Axiom I. 3 remains necessary under DREU. ${ }^{86}$

Proposition I.3: Suppose $T=1$ and $\rho$ admits a DREU representation. Then $\rho$ satisfies Axiom I. 3 .

Proof: Define the following subsets of $\Omega$ :

$$
E:=C\left(p_{1}, A_{1}\right), \quad F:=C\left(p_{0}, A_{0}\right), \quad G:=C\left(p_{0}, B_{0}\right)
$$

Note that $G \subseteq F$ and let $H:=F \backslash G$. We have

$$
\mu(E \mid F)=\mu(E \mid G) \mu(G \mid F)+\mu(E \mid H) \mu(H \mid F)
$$

[^4]Thus,

$$
\begin{align*}
& \left|\rho_{1}\left(p_{1} ; A_{1} \mid A_{0}, p_{0}\right)-\rho_{1}\left(p_{1} ; A_{1} \mid B_{0}, p_{0}\right)\right| \\
& \quad=|\mu(E \mid F)-\mu(E \mid G)| \\
& \quad \leq|1-\mu(G \mid F)|+\mu(H \mid F) \\
& \quad=2\left|1-\frac{\mu(G)}{\mu(F)}\right|=2\left|1-\frac{\rho_{0}\left(p_{0} ; B_{0}\right)}{\rho_{0}\left(p_{0} ; A_{0}\right)}\right| .
\end{align*}
$$

## APPENDIX J: Proofs for Sections A, E, AND I

## J.1. Proof of Proposition A.1

The following three subsections prove Proposition A.1, that is, the equivalence between DREU, BEU, BEB, and their respective $S$-based analogs.

## J.1.1. DREU

"If" direction: Suppose $\rho$ admits an $S$-based DREU representation $\left(S_{t},\left\{\mu_{t}^{s_{t-1}}\right\}_{s_{t-1} \in S_{t-1}}\right.$, $\left.\left\{U_{s_{t}}, \tau_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)_{t=0, \ldots, T}$. We will construct a DREU representation $\left(\hat{\Omega}, \hat{\mathcal{F}}^{*}, \hat{\mu},\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}, \hat{W}_{t}\right)\right)$.

Consider the space $G:=\prod_{t=0}^{T}\left(S_{t} \times \mathbb{R}^{X_{t}}\right)$ of all sequences of states and tie-breaking utilities. Let $\hat{\Omega}:=\left\{\left(s_{0}, W_{0}, \ldots, s_{T}, W_{T}\right) \in G: \prod_{k=0}^{t} \mu_{k}^{s_{k-1}}\left(s_{k}\right)>0\right\}$. Let $\hat{\mathcal{F}}^{*}$ be the restriction to $\hat{\Omega}$ of the product sigma-algebra of the discrete sigma-algebra on $\prod_{t=0}^{T} S_{t}$ and the product Borel sigma-algebra on $\prod_{t=0}^{T} \mathbb{R}^{X_{t}}$. For each $K=\left(\left\{s_{0}\right\}, K_{0}, \ldots,\left\{s_{T}\right\}, K_{T}\right) \in \hat{\mathcal{F}}^{*}$, let $\hat{\mu}(K)=\prod_{t=0}^{T} \mu_{t}^{s_{t-1}}\left(s_{t}\right) \tau_{s_{t}}\left(K_{t}\right)$; by finiteness of $\prod_{t=0}^{T} S_{t}, \hat{\mu}$ extends to a finitely-additive probability measure on $\hat{\Omega}$ in the natural way.

Let $\Pi_{t}$ be the finite partition of $\hat{\Omega}$ whose cells are all the cylinders $C\left(s_{0}, \ldots, s_{t}\right):=\{\hat{\omega} \in$ $\left.\hat{\Omega}: \operatorname{proj}_{S_{0} \times \cdots \times S_{t}}(\hat{\omega})=\left(s_{0}, \ldots, s_{t}\right)\right\}$. Let $\hat{\mathcal{F}}_{t}$ be the sigma-algebra generated by $\Pi_{t}$; by definition of $\hat{\Omega}, \mu\left(\hat{\mathcal{F}}_{t}(\hat{\omega})\right)>0$ for all $\hat{\omega} \in \hat{\Omega}$. Also, $\hat{\mathcal{F}}_{t}(\hat{\omega})=\bigcup_{\hat{\omega}^{\prime} \in \hat{\mathcal{F}}_{t}(\hat{\omega})} \hat{\mathcal{F}}_{t+1}\left(\hat{\omega}^{\prime}\right)$, so $\left(\hat{\mathcal{F}}_{t}\right)_{0 \leq t \leq T} \subseteq \hat{\mathcal{F}}^{*}$ is a filtration. Define $\hat{U}_{t}: \hat{\Omega} \rightarrow \mathbb{R}^{X_{t}}$ by $\hat{U}_{t}(\hat{\omega})=U_{s_{t}}$ where $\operatorname{proj}_{S_{t}}(\hat{\omega})=s_{t}$. Note that $\left(\hat{U}_{t}\right)$ is adapted to $\left(\hat{\mathcal{F}}_{t}\right)$ and that $\hat{U}_{t}(\hat{\omega})$ is nonconstant for each $\hat{\omega}$ since each $U_{s_{t}}$ is nonconstant. Finally, if $\mathcal{F}_{t-1}(\hat{\omega})=\mathcal{F}_{t-1}\left(\hat{\omega}^{\prime}\right)$ and $\mathcal{F}_{t}(\hat{\omega}) \neq \mathcal{F}_{t}\left(\hat{\omega}^{\prime}\right)$, then $\operatorname{proj}_{S_{t-1}}(\hat{\omega})=\operatorname{proj}_{S_{t-1}}(\hat{\omega})=$ $s_{t-1}$ and $\operatorname{proj}_{S_{t}}(\hat{\omega})=s_{t} \neq s_{t}^{\prime}=\operatorname{proj}_{s_{t}}\left(\hat{\omega}^{\prime}\right)$ for some $s_{t-1} \in S_{t-1}$ and $s_{t}, s_{t}^{\prime} \in \operatorname{supp} \mu_{t}^{s_{t-1}}$. By DREU1(a), this implies $\hat{U}_{t}(\hat{\omega}):=U_{s_{t}} \not \approx U_{s_{t}^{\prime}}=: \hat{U}_{t}\left(\hat{\omega}^{\prime}\right)$. Thus, $\left(\mathcal{F}_{t}, U_{t}\right)$ are simple.

Define $\hat{W}_{t}: \hat{\Omega} \rightarrow \mathbb{R}^{X_{t}}$ by $\hat{W}_{t}(\hat{\omega})=W_{t}$ where $\operatorname{proj}_{\mathbb{R}^{X_{t}}}(\hat{\omega})=W_{t}$. Note that for all $A_{t}$, $\hat{\mu}\left(\left\{\hat{\omega} \in \hat{\Omega}:\left|M\left(A_{t}, \hat{W}_{t}\right)\right|=1\right\}\right)=\sum_{\left(s_{0}, \ldots, s_{T}\right)}\left(\prod_{k=0}^{T} \mu_{k}^{s_{k-1}}\left(s_{k}\right)\right) \tau_{s_{t}}\left(\left\{W_{t} \in \mathbb{R}^{X_{t}}:\left|M\left(A_{t}, W_{t}\right)\right|=\right.\right.$ $1\})=1$, since each $\tau_{s_{t}}$ is proper. Thus, $\left(\hat{W}_{t}\right)$ satisfies part (i) of the properness requirement for DREU. Moreover, for any $\hat{\mathcal{F}}_{T}(\hat{\omega})=C\left(s_{0}, \ldots, s_{T}\right)$ and any sequence $\left(B_{t}\right)$ of Borel sets $B_{t} \subseteq \mathbb{R}^{X_{t}}$, the definition of $\hat{\mu}$ implies

$$
\begin{equation*}
\hat{\mu}\left(\bigcap_{t=0}^{T}\left\{\hat{W}_{t} \in B_{t}\right\} \mid C\left(s_{0}, \ldots, s_{T}\right)\right)=\prod_{t=0}^{T} \tau_{s_{t}}\left(B_{t}\right)=\prod_{t=0}^{T} \hat{\mu}\left(\left\{\hat{W}_{t} \in B_{t}\right\} \mid C\left(s_{0}, \ldots, s_{t}\right)\right) \tag{34}
\end{equation*}
$$

Since $\hat{\mathcal{F}}_{T}(\hat{\omega})=C\left(s_{0}, \ldots, s_{T}\right)$ implies $\hat{\mathcal{F}}_{t}(\hat{\omega})=C\left(s_{0}, \ldots, s_{t}\right)$ for all $t \leq T$, this shows that $\left(\hat{W}_{t}\right)$ also satisfies parts (ii) and (iii) of the properness requirement.

Finally, to see that $\left(\hat{\Omega}, \hat{\mathcal{F}}^{*}, \hat{\mu},\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}, \hat{W}_{t}\right)\right)$ represents $\rho$, fix any $h^{t}=\left(A_{0}, p_{0}, \ldots\right.$, $\left.A_{t}, p_{t}\right) \in \mathcal{H}_{t}$. Then

$$
\begin{aligned}
\hat{\mu} & \left(C\left(h^{t}\right)\right) \\
& =\hat{\mu}\left(\bigcap_{k=0}^{t}\left\{\hat{\omega} \in \hat{\Omega}: p_{k} \in M\left(M\left(A_{k}, \hat{U}_{k}(\hat{\omega})\right), \hat{W}_{k}(\hat{\omega})\right)\right\}\right) \\
& =\sum_{C\left(s_{0}, \ldots, s_{t}\right) \in \Pi_{t}} \hat{\mu}\left(C\left(s_{0}, \ldots, s_{t}\right)\right) \hat{\mu}\left(\bigcap_{k=0}^{t}\left\{\hat{\omega} \in \hat{\Omega}: p_{k} \in M\left(M\left(A_{k}, \hat{U}_{k}\right), \hat{W}_{k}\right)\right\} \mid C\left(s_{0}, \ldots, s_{t}\right)\right) \\
& =\sum_{\left(s_{0}, \ldots, s_{t}\right) \in S_{0} \times \ldots \times S_{t}} \prod_{k=0}^{t} \mu_{k}^{s_{k-1}}\left(s_{k}\right) \hat{\mu}\left(\bigcap_{k=0}^{t}\left\{\hat{\omega} \in \hat{\Omega}: p_{k} \in M\left(M\left(A_{k}, U_{s_{k}}\right), \hat{W}_{k}\right)\right\} \mid C\left(s_{0}, \ldots, s_{t}\right)\right) \\
& =\sum_{\left(s_{0}, \ldots, s_{t}\right) \in S_{0} \times \ldots \times S_{t}} \prod_{k=0}^{t} \mu_{k}^{s_{k-1}\left(s_{k}\right) \tau_{s_{k}}\left(p_{k}, A_{k}\right),}
\end{aligned}
$$

where the third equality follows from the definition of $\hat{\mu}$ and $\hat{U}$, and the final equality follows from (34). Thus, as required, we have
$\hat{\mu}\left(C\left(p_{t}, A_{t}\right) \mid C\left(h^{t-1}\right)\right)=\frac{\hat{\mu}\left(C\left(h^{t}\right)\right)}{\hat{\mu}\left(C\left(h^{t-1}\right)\right.}=\frac{\sum_{\left(s_{0}, \ldots, s_{t}\right.} \prod_{k=0}^{t} \mu_{k}^{s_{k-1}}\left(s_{k}\right) \tau_{s_{k}}\left(p_{k}, A_{k}\right)}{\sum_{\left(s_{0}, \ldots, s_{t-1}\right)} \prod_{k=0}^{t-1} \mu_{k}^{s_{k-1}}\left(s_{k}\right) \tau_{s_{k}}\left(p_{k}, A_{k}\right)}=\rho_{t}\left(p_{t} ; A_{t} \mid h^{t-1}\right)$,
where the final equality holds by DREU2.
"Only if" direction: Take any DREU representation $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}, W_{t}\right)\right)$ of $\rho$. We will construct an $S$-based DREU representation $\left(S_{t},\left\{\hat{\mu}_{t}^{s_{t-1}}\right\}_{s_{t-1} \in S_{t-1}},\left\{\hat{U}_{s_{t}}, \tau_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)_{t=0, \ldots, T}$.

For each $t$, let $S_{t}:=\left\{\mathcal{F}_{t}(\omega): \omega \in \Omega\right\}$ denote the partition generating $\mathcal{F}_{t}$, which is finite since $\left(\mathcal{F}_{t}\right)$ is simple. Each $\hat{\mu}_{t+1}^{s_{t}}$ is defined to be the one-step-ahead conditional of $\mu$, that is, $\hat{\mu}_{0}\left(s_{0}\right):=\mu\left(s_{0}\right)$ for all $s_{0} \in S_{0}$ and $\hat{\mu}_{t+1}^{s_{t}}\left(s_{t+1}\right):=\mu\left(s_{t+1} \mid s_{t}\right)$ for all $s_{t} \in S_{t}, s_{t+1} \in S_{t+1}$. This is well-defined since $\mu\left(\mathcal{F}_{t}(\omega)\right)>0$ for all $\omega$. For each $s_{t} \in S_{t}$, define $\hat{U}_{s_{t}}:=U_{t}(\omega)$ if $\omega \in s_{t}$; this is well-defined as $\left(U_{t}\right)$ is $\mathcal{F}_{t}$-adapted and each $U_{s_{t}}$ is nonconstant since each $U_{t}(\omega)$ is nonconstant. Finally, for any Borel set $B_{t} \subseteq \mathbb{R}^{X_{t}}$, define $\tau_{s_{t}}\left(B_{t}\right):=\mu\left(\left\{W_{t} \in B_{t}\right\} \mid s_{t}\right)$. This is well-defined since $W_{t}$ is $\mathcal{F}^{*}$-measurable. Moreover, because $\mu\left(\left\{\omega \in \Omega: \mid M\left(A_{t}, W_{t}(\omega) \mid=\right.\right.\right.$ $1\}=1$ for all $A_{t}$ and $\left|S_{t}\right|$ is finite, it follows that $\tau_{s_{t}}\left(N\left(A_{t}, p_{t}\right)\right)=\tau_{s_{t}}\left(N^{+}\left(A_{t}, p_{t}\right)\right)$ for all $p_{t}$, that is, $\tau_{s_{t}}$ is proper. Thus, each $\left(S_{t}, \mu_{t}^{s_{t-1}},\left\{U_{s_{t}}, \tau_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)$ is an REU form on $X_{t}$.

Moreover, (a) for any distinct $s_{t}, s_{t}^{\prime} \in \operatorname{supp}\left(\mu_{t}^{s_{t-1}}\right)$, we have $\omega$, $\omega^{\prime}$ such that $\mathcal{F}_{t-1}(\omega)=$ $s_{t-1}=\mathcal{F}_{t-1}\left(\omega^{\prime}\right)$ and $\mathcal{F}_{t}(\omega)=s_{t} \neq \mathcal{F}_{t}\left(\omega^{\prime}\right)=s_{t}^{\prime}$. Thus, $\hat{U}_{s_{t}}=U_{t}(\omega) \not \approx U_{t}\left(\omega^{\prime}\right)=\hat{U}_{s_{t}^{\prime}}$, since $\left(U_{t}, \mathcal{F}_{t}\right)$ is simple. Also, since $\left(\mathcal{F}_{t}\right)$ is adapted, the partition $S_{t}$ refines the partition $S_{t-1}$, so that (b) for any distinct $s_{t-1}, s_{t-1}^{\prime}$, we have $\operatorname{supp}\left(\hat{\mu}_{t}^{s_{t-1}}\right) \cap \operatorname{supp}\left(\hat{\mu}_{t}^{s_{t-1}^{\prime}}\right)=\emptyset$. Since additionally $\mu\left(s_{t}\right)>0$ for all $s_{t} \in S_{t}$, we have (c) $\bigcup_{s_{t-1} \in S_{t-1}} \operatorname{supp} \hat{\mu}_{t}^{s_{t-1}}=S_{t}$. Thus, DREU1 is satisfied.

To see that DREU2 holds, observe that for each $h^{t}=\left(A_{0}, p_{0}, \ldots, A_{t}, p_{t}\right) \in \mathcal{H}_{t}$, we have

$$
\begin{aligned}
& \mu\left(C\left(h^{t}\right)\right)=\sum_{s_{T} \in S_{T}} \mu\left(s_{T}\right) \mu\left(C\left(h^{t}\right) \mid s_{T}\right) \\
& =\sum_{s_{T} \in S_{T}} \mu\left(s_{T}\right) \mu\left(\bigcap_{k=0}^{t}\left\{\omega \in \Omega: p_{k} \in M\left(M\left(A_{k}, U_{k}\right), W_{k}\right)\right\} \mid s_{T}\right) \\
& =\sum_{\substack{\left(s_{0}, \ldots, s_{T}\right) \\
\exists \omega \in \Omega \forall t: s_{t}=\mathcal{F}_{t}(\omega)}} \mu\left(s_{T}\right) \mu\left(\bigcap_{k=0}^{t}\left\{p_{k} \in M\left(M\left(A_{k}, U_{s_{k}}\right), W_{k}\right)\right\} \mid s_{t}\right) \\
& =\sum_{\substack{\left(s_{0}, \ldots, s_{T}\right) \\
\exists \omega \in \Omega \forall t: s_{t}=\mathcal{F}_{t}(\omega)}} \mu\left(s_{T}\right) \prod_{k=0}^{t} \mu\left(\left\{p_{k} \in M\left(M\left(A_{k}, U_{s_{k}}\right), W_{k}\right)\right\} \mid s_{k}\right) \\
& =\sum_{\substack{\left(s_{0}, \ldots, s_{t}\right) \\
\exists \omega \in \Omega \forall k \leq t: s_{k}=\mathcal{F}_{k}(\omega)}} \prod_{k=0}^{t} \mu_{k}^{s_{k}-1}\left(s_{k}\right) \prod_{k=0}^{t} \tau_{s_{k}}\left(p_{k}, A_{k}\right) \\
& =\sum_{\left(s_{0}, \ldots, s_{t}\right) \in S_{0} \times \cdots \times S_{t}} \prod_{k=0}^{t} \mu_{k}^{s_{k-1}}\left(s_{k}\right) \prod_{k=0}^{t} \tau_{s_{k}}\left(p_{k}, A_{k}\right),
\end{aligned}
$$

where the third equality follows from the fact that $\left(U_{t}\right)$ is $\mathcal{F}_{t}$-adapted, the fourth equality follows from parts (ii) and (iii) of the properness assumption on $\left(W_{t}\right)$, the final equality follows from the fact that $\prod_{k=0}^{t} \mu_{k}^{s_{k-1}}\left(s_{k}\right)=0$ whenever $\left(s_{0}, \ldots, s_{t}\right) \neq\left(\mathcal{F}_{0}(\omega), \ldots, \mathcal{F}_{t}(\omega)\right)$ for all $\omega$, and the remaining equalities hold by definition. Since $\rho_{t}\left(p_{t} ; A_{t} \mid h^{t-1}\right)=\frac{\mu\left(C\left(h^{t}\right)\right)}{\mu\left(C\left(h^{t-1}\right)\right.}$ by (3), this shows that DREU2 holds.

## J.1.2. $B E U$

"If" direction: Suppose $\rho$ admits an $S$-based BEU representation ( $S_{t},\left\{\mu_{t}^{s_{t-1}}\right\}_{s_{t-1} \in S_{t-1}}$, $\left.\left\{U_{s_{t}}, u_{s_{t}}, \tau_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)_{t=0, \ldots, T}$. Let $\left(\hat{\Omega}, \hat{\mathcal{F}}^{*}, \hat{\mu},\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}, \hat{W}_{t}\right)\right)$ denote the corresponding DREU representation of $\rho$ obtained in the "if" direction for DREU. In addition, define $\hat{u}_{t}$ : $\hat{\Omega} \rightarrow \mathbb{R}^{Z}$ for each $t$ by $\hat{u}_{t}(\hat{\omega}):=u_{s_{t}}$ whenever $\operatorname{proj}_{S_{t}}(\hat{\omega})=s_{t}$. Note that the process $\left(\hat{u}_{t}\right)$ is $\hat{\mathcal{F}}_{t}$-adapted. Moreover, for each $\hat{\omega}=\left(s_{0}, W_{0}, \ldots, s_{T}, W_{T}\right)$, we have $\hat{U}_{T}(\hat{\omega})=U_{s_{T}}=u_{s_{T}}=$ $\hat{u}_{T}(\hat{\omega})$ and, for each $t \leq T-1$ and $\left(z_{t}, A_{t+1}\right)$,

$$
\begin{aligned}
\hat{U}_{t}(\hat{\omega})\left(z_{t}, A_{t+1}\right) & =U_{s_{t}}\left(z_{t}, A_{t+1}\right) \\
& =u_{s_{t}}\left(z_{t}\right)+\sum_{s_{t+1} \in s_{t+1}} \mu_{t+1}^{s_{t}}\left(s_{t+1}\right) \max _{p_{t+1} \in A_{t+1}} U_{s_{t+1}}\left(p_{t+1}\right) \\
& =\hat{u}_{t}(\hat{\omega})\left(z_{t}\right)+\sum_{s_{t+1} \in S_{t+1}} \hat{\mu}\left(s_{t+1} \mid s_{t}\right) \max _{p_{t+1} \in A_{t+1}} U_{s_{t+1}}\left(p_{t+1}\right) \\
& =\hat{u}_{t}(\hat{\omega})\left(z_{t}\right)+\mathbb{E}\left[\max _{p_{t+1} \in A_{t+1}} \hat{U}_{t+1}\left(p_{t+1}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]
\end{aligned}
$$

where we let $\hat{\mu}\left(s_{t+1} \mid s_{t}\right):=\hat{\mu}\left(C\left(s_{0}, \ldots, s_{t+1}\right) \mid C\left(s_{0}, \ldots, s_{t}\right)\right)$. Thus, we constructed a BEU representation with $\delta_{t}(\cdot)=1$ for every $t$.
"Only if" direction: Suppose $\rho$ admits a BEU representation $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}, u_{t}\right.\right.$, $\left.\delta_{t}, W_{t}\right)$ ). We construct another tuple $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}^{\prime}, u_{t}^{\prime}, \delta_{t}^{\prime}, W_{t}\right)\right)$ by setting $U_{t}^{\prime}(\omega):=$ $\prod_{\tau=0}^{t-1} \delta_{\tau}(\omega) U_{t}(\omega), u_{t}^{\prime}(\omega):=\prod_{\tau=0}^{t-1} \delta_{\tau}(\omega) u_{t}(\omega)$, and $\delta_{t}^{\prime}(\omega)=1$ for each $t$ and $\omega$, which are all $\mathcal{F}_{t}$-measurable. By Proposition I.1, $\left(\Omega, \mu,\left(\mathcal{F}_{t}, U_{t}^{\prime}, W_{t}\right)\right)$ is still a DREU representation of $\rho$. Furthermore, for each $\omega$ (omitting its notational dependence),

$$
\begin{aligned}
U_{t}^{\prime}\left(z_{t}, A_{t+1}\right) & =\prod_{\tau=0}^{t-1} \delta_{\tau} U_{t}\left(z_{t}, A_{t+1}\right)=\prod_{\tau=0}^{t-1} \delta_{\tau}\left(u_{t}(z)+\delta_{t} \mathbb{E}\left[\max _{A_{t+1}} U_{t+1} \mid \mathcal{F}_{t}\right]\right) \\
& =u_{t}^{\prime}(z)+\delta_{t} \mathbb{E}\left[\max _{A_{t+1}} U_{t+1}^{\prime} \mid \mathcal{F}_{t}\right]
\end{aligned}
$$

for every $\left(z_{t}, A_{t+1}\right)$. Thus, $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}^{\prime}, u_{t}^{\prime}, \delta_{t}^{\prime}, W_{t}\right)\right)$ is still a BEU representation of $\rho$. Based on this tuple, let $\left(S_{t},\left\{\hat{\mu}_{t}^{s_{t-1}}\right\}_{s_{t-1} \in S_{t-1}},\left\{\hat{U}_{s_{t}}, \tau_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)_{t=0, \ldots, T}$ denote the corresponding $S$-based DREU representation obtained in the "only if" direction for DREU. In addition, for each $s_{t}$, define $\hat{u}_{s_{t}} \in \mathbb{R}^{Z}$ by $\hat{u}_{s_{t}}=u_{t}^{\prime}(\omega)$ for any $\omega \in s_{t}$; this is well-defined as $\left(u_{t}^{\prime}\right)$ is $\mathcal{F}_{t}$-adapted. Reversing the argument in the previous part, we can verify that $\hat{u}_{s_{T}}=\hat{U}_{s_{T}}$ for each $s_{T}$ and $\hat{U}_{s_{t}}\left(z_{t}, A_{t+1}\right)=\hat{u}_{s_{t}}\left(z_{t}\right)+\sum_{s_{t+1}} \hat{\mu}_{t+1}^{s_{t}}\left(s_{t+1}\right) \max _{p_{t+1} \in A_{t+1}} \hat{U}_{s_{t+1}}\left(p_{t+1}\right)$ for each $s_{t}$ with $t \leq T-1$.

## J.1.3. $B E B$

"If" direction: Suppose $\rho$ admits an $S$-based BEB representation $\left(S_{t},\left\{\mu_{t}^{s_{t-1}}\right\}_{s_{t-1} \in S_{t-1}}\right.$, $\left.\left\{U_{s_{t}}, u_{s_{t}}, \tau_{s_{t}}, \delta_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)_{t=0, \ldots, T}$. Let $\left(\hat{\Omega}, \hat{\mathcal{F}}^{*}, \hat{\mu},\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}, \hat{u}_{t}, 1, \hat{W}_{t}\right)\right)$ denote the corresponding BEU representation obtained in the "if" direction for BEU. In addition, define $\hat{\delta}_{t}: \hat{\Omega} \rightarrow \mathbb{R}$ for each $t$ by $\hat{\delta}_{t}(\hat{\omega}):=\delta_{s_{t}}$ whenever $\operatorname{proj}_{S_{t}}(\hat{\omega})=s_{t}$. Note that for each $\hat{\omega}=\left(s_{0}, W_{0}, . ., s_{T}, W_{T}\right)$ and $t \leq T-1$, we have $\hat{u}_{t}(\hat{\omega})=u_{s_{t}}=\frac{1}{\delta_{s_{t}}} \sum_{s_{t+1}} \mu_{t+1}^{s_{t}}\left(s_{t+1}\right) u_{s_{t+1}}=$ $\frac{1}{\hat{\delta}_{t}(\hat{\omega})} \mathbb{E}\left[\hat{u}_{t+1} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]$. Iterating expectations, this yields $\hat{u}_{t}(\hat{\omega})=\mathbb{E}\left[\prod_{\tau=t}^{T-1} \hat{\delta}_{\tau}^{-1} \hat{u}_{T} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]=$ $\mathbb{E}\left[\prod_{\tau=t}^{T-1} \hat{\delta}_{\tau}^{-1} \hat{U}_{T} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]$. Replace $\hat{U}_{t}(\hat{\omega})$ with $\hat{U}_{t}^{\prime}(\hat{\omega}):=\mathbb{E}\left[\prod_{\tau=t}^{T-1} \hat{\delta}_{\tau} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right] \hat{U}_{t}(\hat{\omega})$ for each $t$ and $\hat{\omega}$. By Proposition I.1, $\left(\hat{\Omega}, \hat{\mathcal{F}}^{*}, \hat{\mu},\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}^{\prime}, \hat{W}_{t}\right)\right)$ is still a DREU representation of $\rho$. Moreover, for each $t \leq T-1$, we have

$$
\begin{aligned}
\hat{U}_{t}^{\prime}(\hat{\omega})\left(z_{t}, A_{t+1}\right) & =\mathbb{E}\left[\prod_{\tau=t}^{T-1} \hat{\delta}_{\tau} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right] \hat{u}_{t}(\hat{\omega})\left(z_{t}\right)+\mathbb{E}\left[\prod_{\tau=t}^{T-1} \hat{\delta}_{\tau} \max _{p_{t+1} \in A_{t+1}} \hat{U}_{t+1}\left(p_{t+1}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right] \\
& =\mathbb{E}\left[\hat{U}_{T}^{\prime}\left(z_{t}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]+\hat{\delta}_{t}(\hat{\omega}) \mathbb{E}\left[\max _{p_{t+1} \in A_{t+1}} \hat{U}_{t+1}^{\prime}\left(p_{t+1}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right] .
\end{aligned}
$$

Thus, $\left(\hat{\Omega}, \hat{\mathcal{F}}^{*}, \hat{\mu},\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}^{\prime}, \hat{\delta}_{t}, \hat{W}_{t}\right)\right)$ is a BEB representation of $\rho$.
"Only if" direction: Suppose that $\rho$ admits a BEB representation $\left(\Omega, \mu,\left(\mathcal{F}_{t}, U_{t}, \delta_{t}, W_{t}\right)\right)$. Let $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}^{\prime}, u_{t}^{\prime}, \delta_{t}^{\prime}, W_{t}\right)\right)$ and $\left(S_{t},\left\{\hat{\mu}_{t}^{s_{t-1}}\right\}_{s_{t-1} \in S_{t-1}},\left\{\hat{U}_{s_{t}}^{\prime}, \hat{u}_{s_{t}}^{\prime}, \tau_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)_{t=0, \ldots, T}$ respectively denote the corresponding BEU representation and $S$-based BEU representation of $\rho$ obtained in the "only if" direction for BEU. In addition, define $\hat{\delta}_{s_{t}}:=\delta_{t}(\omega)$ for
$\mathcal{F}_{t}(\omega)=s_{t}$. Then, for each $t \leq T-1$ and $\omega$ with $\mathcal{F}_{t}(\omega)=s_{t}$, we have

$$
\begin{aligned}
\hat{u}_{s_{t}}^{\prime} & =u_{t}^{\prime}(\omega)=\prod_{\tau=0}^{t-1} \delta_{\tau}(\omega) u_{t}(\omega)=\prod_{\tau=0}^{t-1} \delta_{\tau}(\omega) \mathbb{E}\left[u_{t+1}(\omega) \mid \mathcal{F}_{t}(\omega)\right] \\
& =\frac{1}{\delta_{t}(\omega)} \mathbb{E}\left[u_{t+1}^{\prime} \mid \mathcal{F}_{t}(\omega)\right]=\frac{1}{\hat{\delta}_{s_{t}}} \sum_{s_{t+1}} \hat{\mu}_{t+1}^{s_{t}}\left(s_{t+1}\right) \hat{u}_{s_{t}}^{\prime}
\end{aligned}
$$

where the first and last equalities used the construction of $S$-based BEU, and the second and fourth equalities used the construction of BEU. Thus, $\left(S_{t},\left\{\hat{\mu}_{t}^{s_{t-1}}\right\}_{s_{t-1} \in S_{t-1}},\left\{\hat{U}_{s_{t}}^{\prime}, \hat{u}_{s_{t}}^{\prime}\right.\right.$, $\left.\left.\hat{\delta}_{s_{t}}, \tau_{s_{t}}\right\}_{s_{t} \in S_{t}}\right)_{t=0, \ldots, T}$ is an $S$-based BEB representation of $\rho$.

## J.2. Proofs for Appendix E

This appendix presents proofs of all lemmas from Appendix E.

## J.2.1. Proof of Lemma E. 1

By standard arguments, for any separable metric space $(Y, d)$ : (a) the set $\mathcal{P}(Y)$ of Borel probability measures on $Y$ endowed with the topology of weak convergence is a separable metric space metrized by the Prokhorov metric $\pi_{d}$ induced by $d$ (e.g., Theorem 15.12 in Aliprantis and Border (2006)); (b) the set $\mathcal{K}_{C}(Y)$ of nonempty compact subsets of $Y$ endowed with the Hausdorff distance induced by $d$ is a separable metric space (e.g., Khamsi and Kirk (2011, p. 40)); (c) every dense subspace of $Y$ is separable.

We now prove the claim inductively, working backwards from period $T$. Since $X_{T}:=Z$ is finite, the claim is immediate. Consider $t<T$ and suppose that $X_{\tau}$ is a separable metric space for all $\tau \geq t+1$. By (a) above, $\mathcal{P}\left(X_{t+1}\right)$ endowed with the induced Prokhorov metric is separable, so since $\Delta\left(X_{t+1}\right)$ is dense in $\mathcal{P}\left(X_{t+1}\right)$ (e.g., Theorem 15.10 in Aliprantis and Border (2006)), $\Delta\left(X_{t+1}\right)$ is also separable (by (c)). Then by (b) above, $\mathcal{K}_{C}\left(\Delta\left(X_{t+1}\right)\right)$ endowed with the induced Hausdorff metric is separable, so since $\mathcal{A}_{t+1}:=\mathcal{K}\left(\Delta\left(X_{t+1}\right)\right)$ is dense in $\mathcal{K}_{C}\left(\Delta\left(X_{t+1}\right)\right)$ (e.g., Lemma 0 in Gul and Pesendorfer (2001)), $\mathcal{A}_{t+1}$ is also separable. Finally, $X_{t}:=Z \times \mathcal{A}_{t+1}$ endowed with the product of the discrete metric and the Hausdorff metric is separable, as required.

## J.2.2. Proof of Lemma E. 2

By the finiteness of $S$, there is a finite set $Y^{\prime} \subseteq Y$ such that, for each $s$, the restriction $U_{s} \upharpoonright_{Y^{\prime}}$ to $Y^{\prime}$ is nonconstant and for any distinct $s, s^{\prime}, U_{s} \upharpoonright_{Y^{\prime}} \not \approx U_{s^{\prime}} \upharpoonright_{Y^{\prime}}$ (i.e., there exists $p, q \in \Delta\left(Y^{\prime}\right)$ such that $U_{s}(p) \geq U_{s}(q)$ and $\left.U_{s^{\prime}}(p)<U_{s^{\prime}}(q)\right)$. By Lemma 1 in Ahn and Sarver (2013), there is a collection of lotteries $\left\{p^{s}: s \in S\right\} \subseteq \Delta\left(Y^{\prime}\right)$ such that $U_{s}\left(p^{s}\right)=$ $U_{s} \upharpoonright_{Y^{\prime}}\left(p^{s}\right)>U_{s} \upharpoonright_{Y^{\prime}}\left(p^{s^{\prime}}\right)=U_{s}\left(p^{s^{\prime}}\right)$ for any distinct $s, s^{\prime}$.

## J.2.3. Proof of Lemma E. 3

(i) $\Longrightarrow$ (ii): We prove the contrapositive. Suppose that there are $s_{t-1} \in S\left(h^{t-1}\right)$ and $s_{t} \in$ $\operatorname{supp} \mu_{t}^{s_{t-1}}$ such that $\left|M\left(A_{t}, U_{s_{t}}\right)\right|>1$. Pick any $p_{t} \in M\left(A_{t}, U_{s_{t}}\right)$ such that $\tau_{s_{t}}\left(p_{t}, A_{t}\right)>0$. Since $U_{s_{t}}$ is nonconstant, we can find lotteries $\underline{r}, \bar{r} \in \Delta\left(X_{t}\right)$ such that $U_{s_{t}}(\underline{r})<U_{s_{t}}(\bar{r})$. Fix any sequence $\alpha_{n} \in(0,1)$ with $\alpha_{n} \rightarrow 0$. Let $p_{t}^{n}:=\alpha_{n} \underline{r}+\left(1-\alpha_{n}\right) p_{t}$. For every $q_{t} \in A_{t} \backslash\left\{p_{t}\right\}$, let $\underline{q}_{t}^{n}:=\alpha_{n} \underline{r}+\left(1-\alpha_{n}\right) q_{t}$ and $\bar{q}_{t}^{n}:=\alpha_{n} \bar{r}+\left(1-\alpha_{n}\right) q_{t}$. Let $\underline{B}_{t}^{n}:=\left\{\underline{q}_{t}^{n}: q_{t} \in A_{t} \backslash\left\{p_{t}\right\}\right\}$, let $\bar{B}_{t}^{n}:=\left\{\bar{q}_{t}^{n}: q_{t} \in A_{t} \backslash\left\{p_{t}\right\}\right\}$, and let $B_{t}^{n}:=\underline{B}_{t}^{n} \cup \bar{B}_{t}^{n}$. Then $B_{t}^{n} \rightarrow^{m} A_{t} \backslash\left\{p_{t}\right\}$ and $p_{t}^{n} \rightarrow^{m} p_{t}$.

Moreover, since $\left|M\left(A_{t}, U_{s_{t}}\right)\right|>1$, there exists $q_{t} \in A_{t} \backslash\left\{p_{t}\right\}$ such that $U_{s_{t}}\left(\alpha_{n} \bar{r}+(1-\right.$ $\left.\left.\alpha_{n}\right) q_{t}\right)>U_{s_{t}}\left(p_{t}^{n}\right)$ for all $n$, so that $\tau_{s_{t}}\left(p_{t}^{n}, B_{t}^{n} \cup\left\{p_{t}^{n}\right\}\right)=0$. Furthermore, note that for all $s_{t}^{\prime} \in S_{t} \backslash\left\{s_{t}\right\}$, we have $N\left(M\left(A_{t}, U_{s_{t}^{\prime}}\right), p_{t}\right)=N\left(M\left(\underline{B}_{t}^{n} \cup\left\{p_{t}^{n}\right\}, U_{s_{t}^{\prime}}\right), p_{t}^{n}\right) \supseteq N\left(M\left(B_{t}^{n} \cup\right.\right.$ $\left.\left.\left\{p_{t}^{n}\right\}, U_{s_{t}^{\prime}}\right), p_{t}^{n}\right)$, so that $\tau_{s_{t}^{\prime}}\left(p_{t}, A_{t}\right) \geq \tau_{s_{t}^{\prime}}\left(p_{t}^{n}, B_{t}^{n} \cup\left\{p_{t}^{n}\right\}\right)$ for all $n$. Letting pred $\left(s_{t-1}\right)=$ $\left(s_{0}, \ldots, s_{t-2}\right)$, Lemma E. 5 then implies that for all $n$,

$$
\begin{aligned}
& \rho_{t}\left(p_{t} ; A_{t} \mid h^{t-1}\right)-\rho_{t}\left(p_{t}^{n} ; B_{t}^{n} \cup\left\{p_{t}^{n}\right\} \mid h^{t-1}\right) \\
& \quad=\frac{\sum_{s_{0}^{\prime}, \ldots, s_{t}^{\prime}} \prod_{k=0}^{t-1} \mu_{k}^{s_{k-1}^{\prime}}\left(s_{k}^{\prime}\right) \tau_{s_{k}^{\prime}}\left(p_{k}, A_{k}\right) \mu_{t}^{s_{t-1}^{\prime}}\left(s_{t}^{\prime}\right)\left(\tau_{s_{t}^{\prime}}\left(p_{t}, A_{t}\right)-\tau_{s_{t}^{\prime}}\left(p_{t}^{n}, B_{t}^{n} \cup\left\{p_{t}^{n}\right\}\right)\right)}{\sum_{s_{0}^{\prime}, \ldots, s_{t-1}^{\prime}} \prod_{k=0}^{t-1} \mu_{k}^{s_{k-1}^{\prime}}\left(s_{k}^{\prime}\right) \tau_{s_{k}^{\prime}}\left(p_{k}, A_{k}\right)} \\
& \quad \geq \frac{\prod_{k=0}^{t-1} \mu_{k}^{s_{k-1}}\left(s_{k}\right) \tau_{s_{k}}\left(p_{k}, A_{k}\right) \mu_{t}^{s_{t-1}}\left(s_{t}\right) \tau_{s_{t}}\left(p_{t}, A_{t}\right)}{\sum_{s_{0}^{\prime}, \ldots, s_{t-1}^{\prime}} \sum_{s_{0}^{\prime}, \ldots, s_{t-1}^{\prime}} \prod_{k=0}^{t-1} \mu_{k}^{s_{k-1}^{\prime}}\left(s_{k}^{\prime}\right) \tau_{s_{k}^{\prime}}\left(p_{k}, A_{k}\right)}>0 .
\end{aligned}
$$

Since the last line does not depend on $n$, this implies $\lim _{n \rightarrow \infty} \rho_{t}\left(p_{t}^{n} ; B_{t}^{n} \cup\left\{p_{t}^{n}\right\} \mid h^{t-1}\right)<$ $\rho_{t}\left(p_{t} ; A_{t} \mid h^{t-1}\right)$. By definition of $\mathcal{A}_{t}^{*}$, this means $A_{t} \notin \mathcal{A}_{t}^{*}\left(h^{t-1}\right)$.
(ii) $\Longrightarrow$ (i): Suppose $A_{t}$ satisfies (ii). Consider any $p_{t} \in A_{t}, p_{t}^{n} \rightarrow^{m} p_{t}, B_{t}^{n} \rightarrow^{m} A_{t} \backslash\left\{p_{t}\right\}$. Consider any $s_{t-1} \in S\left(h^{t-1}\right)$ and $s_{t} \in \operatorname{supp} \mu_{t}^{s_{t-1}}$. By (ii), we either have $M\left(A_{t}, U_{s_{t}}\right)=\left\{p_{t}\right\}$ or $p_{t} \notin M\left(A_{t}, U_{s_{t}}\right)$. In the former case, $U_{s_{t}}\left(p_{t}\right)>U_{s_{t}}\left(q_{t}\right)$ for all $q_{t} \in A_{t} \backslash\left\{p_{t}\right\}$. But then, for all $n$ large enough, linearity of $U_{s_{t}}$ implies $U_{s_{t}}\left(p_{t}^{n}\right)>U_{s_{t}}\left(q_{t}^{n}\right)$ for all $q_{t}^{n} \in B_{t}^{n}$, that is, $\tau_{s_{t}}\left(p_{t}, A_{t}\right)=\lim _{n} \tau_{s_{t}}\left(p_{t}^{n}, B_{t}^{n} \cup\left\{p_{t}^{n}\right\}\right)=1$. In the latter case, $U_{s_{t}}\left(p_{t}\right)<U_{s_{t}}\left(q_{t}\right)$ for some $q_{t} \in A_{t} \backslash\left\{p_{t}\right\}$. But then, for all $n$ large enough, linearity of $U_{s_{t}}$ implies $U_{s_{t}}\left(p_{t}^{n}\right)<U_{s_{t}}\left(q_{t}^{n}\right)$ for all $q_{t}^{n} \in B_{t}^{n}$ such that $q_{t}^{n} \rightarrow{ }^{m} q_{t}$, that is, $\tau_{s_{t}}\left(p_{t}, A_{t}\right)=\lim _{n} \tau_{s_{t}}\left(p_{t}^{n}, B_{t}^{n} \cup\left\{p_{t}^{n}\right\}\right)=0$.

Thus, for all $s_{t-1} \in S\left(h^{t-1}\right)$ and $s_{t} \in \operatorname{supp} \mu_{t}^{s_{t-1}}$, we have $\tau_{s_{t}}\left(p_{t}, A_{t}\right)=\lim _{n} \tau_{s_{t}}\left(p_{t}^{n}, B_{t}^{n} \cup\right.$ $\left.\left\{p_{t}^{n}\right\}\right)$. Hence, the representation in Lemma E. 5 implies that for all $n$ sufficiently large,

$$
\rho_{t}\left(p_{t}^{n} ; B_{t}^{n} \cup\left\{p_{t}^{n}\right\} \mid h^{t-1}\right)=\rho_{t}\left(p_{t} ; A_{t} \mid h^{t-1}\right)
$$

as required.

## J.2.4. Proof of Lemma E. 4

Let $k:=\max \left\{n=0 \ldots, t-1: q_{n} \neq \hat{q}_{n}\right\}$ be the last entry at which $d^{t-1}$ and $\hat{d}^{t-1}$ differ, where we set $k=-1$ if $q_{n}=\hat{q}_{n}$ for all $n=0, \ldots, t-1$. We prove the claim by induction on $k$.

Suppose first that $k=-1$, that is, that $d^{t-1}=\hat{d}^{t-1}$. If $\lambda_{0}>\hat{\lambda}_{0}$, then the 0 th entry of $\lambda h^{t-1}+(1-\lambda) d^{t-1}$ can be written as an appropriate mixture of the 0 th entry of $\hat{\lambda} h^{t-1}+$ $(1-\hat{\lambda}) \hat{d}^{t-1}$ with $\left(A_{0}, p_{0}\right)$; if $\lambda_{0} \leq \hat{\lambda}_{0}$, then the 0 th entry of $\lambda h^{t-1}+(1-\lambda) d^{t-1}$ can be written as an appropriate mixture of the 0th entry of $\hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}$ with $\left(\left\{q_{0}\right\}, q_{0}\right)$. In either case, Axiom B. 2 implies that $\rho_{t}\left(\cdot ; A_{t} \mid \hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}\right)$ is unaffected after replacing the 0 th entry of $\hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}$ with the 0 th entry of $\lambda h^{t-1}+(1-\lambda) d^{t-1}$. Continuing this way, we can successively apply Axiom B. 2 to replace each entry of $\hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}$
with the corresponding entry of $\lambda h^{t-1}+(1-\lambda) d^{t-1}$ without affecting $\rho_{t}$. This yields the desired conclusion.

Suppose the claim holds whenever $k \leq m-1$ for some $0 \leq m \leq t-1$. We show that the claim continues to hold for $k=m$. Note first that we can assume that

$$
\begin{align*}
& \frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}, \frac{1}{2} h^{t-1}+\frac{1}{2} \hat{d}^{t-1} \in \mathcal{H}_{t-1}\left(A_{t}\right) \\
& \frac{2}{3} B_{m}+\frac{1}{3}\left\{\hat{q}_{m}\right\},\left\{\frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right\} \in \operatorname{supp} q_{m-1}^{A}  \tag{35}\\
& \frac{2}{3} \hat{B}_{m}+\frac{1}{3}\left\{q_{m}\right\},\left\{\frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right\} \in \operatorname{supp} \hat{q}_{m-1}^{A}
\end{align*}
$$

where $B_{m}:=\frac{1}{2} A_{m}+\frac{1}{2}\left\{q_{m}\right\}, \hat{B}_{m}:=\frac{1}{2} A_{m}+\frac{1}{2}\left\{\hat{q}_{m}\right\}, r_{m}:=\frac{1}{2} p_{m}+\frac{1}{2} q_{m}$, and $\hat{r}_{m}:=\frac{1}{2} p_{m}+\frac{1}{2} \hat{q}_{m}$.
Indeed, we can find a sequence of lotteries $\left(\ell_{n}\right)_{n=0}^{t-1}$ such that for all $n=1, \ldots, t-1$,

$$
\begin{array}{r}
\lambda_{n} A_{n}+\left(1-\lambda_{n}\right)\left\{o_{n}\right\}, \frac{1}{2} A_{n}+\frac{1}{2}\left\{o_{n}\right\}, \hat{\lambda}_{n} A_{n}+\left(1-\hat{\lambda}_{n}\right)\left\{\hat{o}_{n}\right\}, \frac{1}{2} A_{n}+\frac{1}{2}\left\{\hat{o}_{n}\right\},\left\{o_{n}\right\} \in \operatorname{supp} \ell_{n-1}^{A} \\
\frac{2}{3} B_{m}+\frac{1}{3}\left\{\hat{o}_{m}\right\}, \frac{2}{3} \hat{B}_{m}+\frac{1}{3}\left\{o_{m}\right\},\left\{\frac{1}{2} o_{m}+\frac{1}{2} \hat{o}_{m}\right\} \in \operatorname{supp} \ell_{m-1}^{A},
\end{array}
$$

where $o_{n}:=\frac{1}{2} q_{n}+\frac{1}{2} \ell_{n}$ and $\hat{o}_{n}:=\frac{1}{2} \hat{q}_{n}+\frac{1}{2} \ell_{n}$. Letting $c^{t-1}:=\left(\left\{o_{n}\right\}, o_{n}\right)_{n=0}^{t-1}$ and $\hat{c}^{t-1}:=$ $\left(\left\{\hat{o}_{n}\right\}, \hat{o}_{n}\right)_{n=0}^{t-1}$, we have that $c^{t-1}, \hat{c}^{t-1} \in \mathcal{D}_{t-1}, \lambda h^{t-1}+(1-\lambda) c^{t-1}, \hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{c}^{t-1} \in$ $\mathcal{H}_{t-1}\left(A_{t}\right)$, and the last entry at which $c^{t-1}$ and $\hat{c}^{t-1}$ differ is $m$. Moreover, repeated application of Axiom B. 2 implies

$$
\begin{aligned}
& \rho_{t}\left(\cdot ; A_{t} \mid \lambda h^{t-1}+(1-\lambda) d^{t-1}\right)=\rho_{t}\left(\cdot ; A_{t} \mid \lambda h^{t-1}+(1-\lambda) c^{t-1}\right) \\
& \rho_{t}\left(\cdot ; A_{t} \mid \hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}\right)=\rho_{t}\left(\cdot ; A_{t} \mid \hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{c}^{t-1}\right) .
\end{aligned}
$$

Thus, we can replace $d^{t-1}$ and $\hat{d}^{t-1}$ with $c^{t-1}$ and $\hat{c}^{t-1}$ if need be and guarantee that (35) is satisfied.

Given (35), $\frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}, \frac{1}{2} h^{t-1}+\frac{1}{2} \hat{d}^{t-1} \in \mathcal{H}_{t-1}\left(A_{t}\right)$, so the base case of the proof implies

$$
\begin{align*}
& \rho_{t}\left(\cdot ; A_{t} \mid \lambda h^{t-1}+(1-\lambda) d^{t-1}\right)=\rho_{t}\left(\cdot ; A_{t} \left\lvert\, \frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}\right.\right) \\
& \rho_{t}\left(\cdot ; A_{t} \mid \hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}\right)=\rho_{t}\left(\cdot ; A_{t} \left\lvert\, \frac{1}{2} h^{t-1}+\frac{1}{2} \hat{d}^{t-1}\right.\right) \tag{36}
\end{align*}
$$

Also, (35) guarantees that $\left(\left(\frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}\right)_{-m},\left(\frac{2}{3} B_{m}+\frac{1}{3}\left\{\hat{q}_{m}\right\}, \frac{2}{3} r_{m}+\frac{1}{3} \hat{q}_{m}\right)\right)$ and $\left(\left(\frac{1}{2} h^{t-1}+\right.\right.$ $\left.\left.\frac{1}{2} \hat{d}^{t-1}\right)_{-m},\left(\frac{2}{3} \hat{B}_{m}+\frac{1}{3}\left\{q_{m}\right\}, \frac{2}{3} \hat{r}_{m}+\frac{1}{3} q_{m}\right)\right)$ are well-defined histories in $\mathcal{H}_{t-1}\left(A_{t}\right)$. Thus, by Ax-
iom B.2,

$$
\begin{align*}
\rho_{t}\left(\cdot ; A_{t} \left\lvert\, \frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}\right.\right)= & \rho_{t}\left(\cdot ; A_{t} \left\lvert\,\left(\frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}\right)_{-m}\right.\right. \\
& \left.\left(\frac{2}{3} B_{m}+\frac{1}{3}\left\{\hat{q}_{m}\right\}, \frac{2}{3} r_{m}+\frac{1}{3} \hat{q}_{m}\right)\right) \\
\rho_{t}\left(\cdot ; A_{t} \left\lvert\, \frac{1}{2} h^{t-1}+\frac{1}{2} \hat{d}^{t-1}\right.\right)= & \rho_{t}\left(\cdot ; A_{t} \left\lvert\,\left(\frac{1}{2} h^{t-1}+\frac{1}{2} \hat{d}^{t-1}\right)_{-m}\right.,\right.  \tag{37}\\
& \left.\left(\frac{2}{3} \hat{B}_{m}+\frac{1}{3}\left\{q_{m}\right\}, \frac{2}{3} \hat{r}_{m}+\frac{1}{3} q_{m}\right)\right)
\end{align*}
$$

But note that

$$
\begin{aligned}
\left(\frac{2}{3} B_{m}+\frac{1}{3}\left\{\hat{q}_{m}\right\}, \frac{2}{3} r_{m}+\frac{1}{3} \hat{q}_{m}\right) & =\left(\frac{1}{3} A_{m}+\frac{2}{3}\left\{\frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right\}, \frac{1}{3} p_{m}+\frac{2}{3}\left(\frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right)\right) \\
& =\left(\frac{2}{3} \hat{B}_{m}+\frac{1}{3}\left\{q_{m}\right\}, \frac{2}{3} \hat{r}_{m}+\frac{1}{3} q_{m}\right) .
\end{aligned}
$$

Thus, $\left(\left(\frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}\right)_{-m},\left(\frac{2}{3} B_{m}+\frac{1}{3}\left\{\hat{q}_{m}\right\}, \frac{2}{3} r_{m}+\frac{1}{3} \hat{q}_{m}\right)\right)$ is an entry-wise mixture of $h^{t-1}$ with the degenerate history $e^{t-1}:=\left(\left(d^{t-1}\right)_{-m},\left(\left\{\frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right\}, \frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right)\right)$ and similarly $\left(\left(\frac{1}{2} h^{t-1}+\frac{1}{2} \hat{d}^{t-1}\right)_{-m},\left(\frac{2}{3} \hat{B}_{m}+\frac{1}{3}\left\{q_{m}\right\}, \frac{2}{3} \hat{r}_{m}+\frac{1}{3} q_{m}\right)\right)$ is an entry-wise mixture of $h^{t-1}$ with the degenerate history $\hat{e}^{t-1}:=\left(\left(\hat{d}^{t-1}\right)_{-m},\left(\left\{\frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right\}, \frac{1}{2} q_{m}+\frac{1}{2} \hat{q}_{m}\right)\right)$. But the last entry at which $e^{t-1}$ and $\hat{e}^{t-1}$ differ is strictly smaller than $m$. Hence, applying the inductive hypothesis, we obtain

$$
\begin{align*}
& \rho_{t}\left(\cdot ; A_{t} \left\lvert\,\left(\frac{1}{2} h^{t-1}+\frac{1}{2} d^{t-1}\right)_{-m}\right.,\left(\frac{2}{3} B_{m}+\frac{1}{3}\left\{q_{m}\right\}, \frac{2}{3} r_{m}+\frac{1}{3} q_{m}\right)\right) \\
& \quad=\rho_{t}\left(\cdot ; A_{t} \left\lvert\,\left(\frac{1}{2} h^{t-1}+\frac{1}{2} \hat{d}^{t-1}\right)_{-m}\right.,\left(\frac{2}{3} \hat{B}_{m}+\frac{1}{3}\left\{q_{m}\right\}, \frac{2}{3} \hat{r}_{m}+\frac{1}{3} q_{m}\right)\right) \tag{38}
\end{align*}
$$

Combining (36), (37), and (38) yields the required equality

$$
\rho_{t}\left(\cdot ; A_{t} \mid \lambda h^{t-1}+(1-\lambda) d^{t-1}\right)=\rho_{t}\left(\cdot ; A_{t} \mid \hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}\right)
$$

Finally, let $\hat{d}^{t-1}$ and $\hat{\lambda} \in(0,1]$ be the choices from Definition 10 such that $\rho_{t}^{h^{t-1}}\left(\cdot ; A_{t}\right):=$ $\rho_{t}\left(\cdot ; A_{t} \mid \hat{\lambda} h^{t-1}+(1-\hat{\lambda}) \hat{d}^{t-1}\right)$. Then the above implies that $\rho_{t}^{h^{t-1}}\left(\cdot ; A_{t}\right)=\rho_{t}\left(\cdot ; A_{t} \mid \lambda h^{t-1}+\right.$ $(1-\lambda) d^{t-1}$ ), as claimed.

## J.2.5. Proof of Lemma E. 5

If $h^{t^{\prime}-1} \in \mathcal{H}_{t^{\prime}-1}\left(A_{t^{\prime}}\right)$, the claim is immediate from DREU2. So suppose $h^{t^{\prime}-1} \notin$ $\mathcal{H}_{t^{\prime}-1}\left(A_{t^{\prime}}\right)$. Let $\lambda \in(0,1)$ and $d^{t^{\prime}-1}=\left(\left\{q_{\ell}\right\}, q_{\ell}\right)_{\ell=0}^{t^{\prime}-1} \in \mathcal{D}_{t^{\prime}-1}$ be the choices from Definition 11 such that $\lambda h^{t^{\prime}-1}+(1-\lambda) d^{t^{\prime}-1} \in \mathcal{H}_{t^{\prime}-1}\left(A_{t^{\prime}}\right)$ and $\rho_{t^{\prime}}\left(p_{t^{\prime}}, A_{t^{\prime}} \mid h^{t^{\prime}-1}\right):=\rho_{t^{\prime}}\left(p_{t^{\prime}}, A_{t^{\prime}} \mid\right.$ $\left.\lambda h^{t^{\prime}-1}+(1-\lambda) d^{t^{\prime}-1}\right)$.

Note that for all $k \leq t^{\prime}, s_{k} \in S_{k}$, and $w \in \mathbb{R}^{X_{k}}$, we have $p_{k} \in M\left(M\left(A_{k}, U_{s_{k}}\right), w\right)$ if and only if $\lambda p_{k}+(1-\lambda) q_{k} \in M\left(M\left(\lambda A_{k}+(1-\lambda)\left\{q_{k}\right\}, U_{s_{k}}\right), w\right)$. Hence, $\tau_{s_{k}}\left(p_{k}, A_{k}\right)=$ $\tau_{s_{k}}\left(\lambda p_{k}+(1-\lambda) q_{k}, \lambda A_{k}+(1-\lambda)\left\{q_{k}\right\}\right)$. Thus, the claim follows from DREU2 applied to the history $\lambda h^{t^{\prime}-1}+(1-\lambda) d^{t^{\prime}-1} \in \mathcal{H}_{t^{\prime}-1}\left(A_{t^{\prime}}\right)$.

## J.2.6. Proof of Lemma E. 6

Let $S_{t}\left(s_{t-1}\right):=\operatorname{supp} \mu_{t}^{s_{t-1}}$. By DREU1, we can find a finite $Y_{t} \subseteq X_{t}$ such that (i) for any $s_{t} \in S_{t}\left(s_{t-1}\right), U_{s_{t}}$ is nonconstant over $Y_{t}$; (ii) for any distinct $s_{t}, s_{t}^{\prime} \in S_{t}\left(s_{t-1}\right), U_{s_{t}} \not \approx U_{s_{t}^{\prime}}$ over $Y_{t}$; and (iii) $\bigcup_{p_{t} \in A_{t}} \operatorname{supp} p_{t} \subseteq Y_{t}$. By (i) and (ii) and Lemma E.2, we can find a menu $D_{t}:=\left\{q_{t}^{s_{t}}: s_{t} \in S_{t}\left(s_{t-1}\right)\right\} \subseteq \Delta\left(Y_{t}\right)$ such that $M\left(D_{t}, U_{s_{t}}\right)=\left\{q_{t}^{s_{t}}\right\}$ for all $s_{t} \in S_{t}\left(s_{t-1}\right)$. Define $b_{t}:=\sum_{y \in Y_{t}} \frac{1}{\left|Y_{t}\right|} \delta_{y} \in \Delta(Y)$. For each $s_{t} \in S_{t}\left(s_{t-1}\right)$, pick $z^{s_{t}} \in \operatorname{argmax}_{y \in Y} U_{s_{t}}$ and let $g_{t}^{s_{t}}:=\delta_{z^{s_{t}}}$. By (i), we have $U_{s_{t}}\left(g_{t}^{s_{t}}\right)>U_{s_{t}}\left(b_{t}\right)$ for all $s_{t} \in S_{t}\left(s_{t-1}\right)$. Hence, there exists $\alpha \in(0,1)$ small enough such that for all $s_{t} \in S_{t}\left(s_{t-1}\right)$, we have $U_{s_{t}}\left(\hat{q}^{s_{t}}\right)>U_{s_{t}}\left(b_{t}\right)$, where $\hat{q}^{s_{t}}:=\alpha q_{t}^{s_{t}}+(1-$ $\alpha) g_{t}^{s_{t}}$. Note that setting $\hat{D}:=\left\{\hat{q}_{t}^{s_{t}}: s_{t} \in S_{t}\left(s_{t-1}\right)\right\}$, we still have $M\left(\hat{D}_{t}, U_{s_{t}}\right)=\left\{\hat{q}_{t}^{s_{t}}\right\}$.

For each $s_{t} \in S_{t}\left(s_{t-1}\right)$, pick some $p_{t}\left(s_{t}\right) \in M\left(A_{t}, U_{s_{t}}\right)$. For the "moreover" part, we can ensure that $p_{t}\left(s_{t}^{*}\right)=p_{t}^{*}$. Fix any sequence $\left(\varepsilon_{n}\right)$ from $(0,1)$ such that $\varepsilon_{n} \rightarrow 0$. For each $n$ and $s_{t} \in S_{t}\left(s_{t-1}\right)$, let $p_{t}^{n}\left(s_{t}\right):=(1-\varepsilon) p_{t}\left(s_{t}\right)+\varepsilon \hat{q}_{t}^{s_{t}}$. And for each $r_{t} \in A_{t}$, let $r_{t}^{n}:=$ $(1-\varepsilon) r_{t}+\varepsilon b_{t}$. Finally, let $A_{t}^{n}:=\left\{p_{t}^{n}\left(s_{t}\right): s_{t} \in S_{t}\left(s_{t-1}\right)\right\} \cup\left\{r_{t}^{n}: r_{t} \in A_{t}\right\}$. Note that $A_{t}^{n} \rightarrow^{m} A_{t}$. Moreover, by construction, for all $s_{t} \in S_{t}\left(s_{t-1}\right)$ and $n$, we have $M\left(A_{t}^{n}, U_{s_{t}}\right)=\left\{p_{t}^{n}\left(s_{t}\right)\right\}$ : Indeed, $U_{s_{t}}\left(p_{t}^{n}\left(s_{t}\right)\right)>U_{s_{t}}\left(r_{t}^{n}\right)$ for all $r_{t} \in A_{t}$ since $U_{s_{t}}\left(p_{t}\left(s_{t}\right)\right) \geq U_{s_{t}}\left(r_{t}\right)$ and $U_{s_{t}}\left(\hat{q}_{t}^{s_{t}}\right)>U_{s_{t}}\left(b_{t}\right)$; and $U_{s_{t}}\left(p_{t}^{n}\left(s_{t}\right)\right)>U_{s_{t}}\left(p_{t}^{n}\left(s_{t}^{\prime}\right)\right)$ for all $s_{t}^{\prime} \neq s_{t}$, since $U_{s_{t}}\left(p_{t}\left(s_{t}\right)\right) \geq U_{s_{t}}\left(p_{t}\left(s_{t}^{\prime}\right)\right)$ and $U_{s_{t}}\left(\hat{q}_{t}^{s_{t}}\right)>$ $U_{s_{t}}\left(\hat{q}_{t}^{s_{t}^{\prime}}\right)$.

Since $s_{t-1}$ is the only state consistent with $h^{t-1}$, Lemma E. 3 implies that $A_{t}^{n} \in \mathcal{A}_{t}^{*}\left(h^{t-1}\right)$, as required. Finally, for the "moreover" part, note that we ensured that $p_{t}\left(s_{t}^{*}\right)=p_{t}^{*}$. Hence, $p_{t}^{n}\left(s_{t}^{*}\right)$ constructed above has the desired property that $p_{t}^{n}\left(s_{t}^{*}\right) \rightarrow^{m} p_{t}^{*}$ and $\mathcal{U}_{s_{t}}\left(A_{t}^{n}, p_{t}^{n}\left(s_{t}^{*}\right)\right)=\left\{U_{s_{t}^{*}}\right\}$ for all $n$.

## J.3. Proof of Proposition I. 1

## J.3.1. "If" Directions

DREU: Consider any $h^{t}=\left(p_{0}, A_{0}, \ldots, p_{t}, A_{t}\right) \in \mathcal{H}_{t}$. Then

$$
\begin{aligned}
\mu\left(C\left(h^{t}\right)\right)= & \sum_{\mathcal{F}_{T}(\omega) \in \Pi_{T}} \mu\left(\mathcal{F}_{T}(\omega)\right) \mu\left(\bigcap_{k=0}^{t}\left\{p_{k} \in M\left(M\left(A_{k}, U_{k}\right), W_{k}\right)\right\} \mid \mathcal{F}_{T}(\omega)\right) \\
= & \sum_{\mathcal{F}_{t}(\omega) \in \Pi_{t}} \prod_{k=0}^{t} \mu\left(\mathcal{F}_{k}(\omega) \mid \mathcal{F}_{k-1}(\omega)\right) \mu\left(\left\{W_{k} \in N\left(M\left(A_{k}, U_{k}(\omega)\right), p_{k}\right)\right\} \mid \mathcal{F}_{k}(\omega)\right) \\
= & \sum_{\mathcal{F}_{t}(\omega) \in \Pi_{t}} \prod_{k=0}^{t} \hat{\mu}\left(\phi_{k}\left(\mathcal{F}_{k}(\omega)\right) \mid \phi_{k-1}\left(\mathcal{F}_{k-1}(\omega)\right)\right) \\
& \times \hat{\mu}\left(\left\{\hat{W}_{k} \in N\left(M\left(A_{k}, U_{k}(\omega)\right), p_{k}\right)\right\} \mid \phi_{k}\left(\mathcal{F}_{k}(\omega)\right)\right) \\
= & \sum_{\hat{\mathcal{F}}_{t}(\hat{\omega}) \in \hat{\Pi}_{t}} \prod_{k=0}^{t} \hat{\mu}\left(\hat{\mathcal{F}}_{k}(\hat{\omega}) \mid \hat{\mathcal{F}}_{k-1}(\omega)\right) \hat{\mu}\left(\left\{\hat{W}_{k} \in N\left(M\left(A_{k}, \hat{U}_{k}(\hat{\omega})\right), p_{k}\right)\right\} \mid \hat{\mathcal{F}}_{k}(\hat{\omega})\right)
\end{aligned}
$$

$$
=\sum_{\hat{\mathcal{F}}_{T}(\hat{\omega}) \in \hat{I}_{T}} \hat{\mu}\left(\hat{\mathcal{F}}_{T}(\hat{\omega})\right)\left(\bigcap_{k=0}^{t}\left\{p_{k} \in M\left(M\left(A_{k}, \hat{U}_{k}\right), \hat{W}_{k}\right)\right\} \mid \hat{\mathcal{F}}_{T}(\hat{\omega})\right)=\hat{\mu}\left(\hat{C}\left(h^{t}\right)\right),
$$

where the second equality follows from properness of $\left(W_{t}\right)$ and $\mathcal{F}_{t}$-adaptedness of $\left(U_{t}\right)$, the third equality follows from assumptions (i) and (iii), the fourth equality from the fact that $\phi_{t}$ is a bijection and assumption (ii), the fifth equality from the properness of $\left(\hat{W}_{t}\right)$ and $\hat{\mathcal{F}}_{t}$-adaptedness of $\left(\hat{U}_{t}\right)$, and the first and last equalities hold by definiton. Since $\mathcal{D}$ represents $\rho$ and $\hat{\mathcal{D}}$ represents $\hat{\rho}$, this implies $\rho_{t}\left(p_{t}, A_{t} \mid h^{t-1}\right)=\frac{\mu\left(C\left(h^{t}\right)\right)}{\mu\left(C\left(h^{t-1}\right)\right)}=\frac{\hat{\mu}\left(\hat{C}\left(h^{t}\right)\right)}{\hat{\mu}\left(\hat{\mathcal{C}}\left(h^{t-1}\right)\right)}=$ $\hat{\rho}_{t}\left(p_{t}, A_{t} \mid h^{t-1}\right)$. Thus, $\hat{\rho}=\rho$, as required.
$B E U$ : By the "if" direction for DREU, $\hat{\mathcal{D}}$ is a DREU representation of $\rho$. It remains to show that $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ satisfies (1). From assumptions (ii), (iv), and (v), it is immediate that $\hat{U}_{T}=\hat{u}_{T}$. Moreover, for all $t \leq T-1$, and $\omega \in \Omega, \hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$, we have

$$
\begin{aligned}
\alpha_{t}(\omega) & \hat{U}_{t}(\hat{\omega})\left(z, A_{t+1}\right) \\
= & U_{t}(\omega)\left(z, A_{t+1}\right)-\beta_{t}(\omega)=u_{t}(\omega)(z)-\beta_{t}(\omega)+\delta_{t}(\omega) \mathbb{E}_{\mu}\left[\max _{p_{t+1} \in A_{t+1}} U_{t+1}\left(p_{t+1}\right) \mid \mathcal{F}_{t}(\omega)\right] \\
= & \alpha_{t}(\omega) \hat{u}_{t}(\hat{\omega})(z)-\delta_{t}(\omega) \mathbb{E}_{\mu}\left[\beta_{t+1} \mid \mathcal{F}_{t}(\omega)\right] \\
& +\delta_{t}(\omega) \mathbb{E}_{\hat{\mu}}\left[\alpha_{t+1} \max _{p_{t+1} \in A_{t+1}} \hat{U}_{t+1}\left(p_{t+1}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]+\delta_{t}(\omega) \mathbb{E}_{\mu}\left[\beta_{t+1} \mid \mathcal{F}_{t}(\omega)\right] \\
= & \alpha_{t}(\omega)\left(\hat{u}_{t}(\hat{\omega})(z)+\hat{\delta}_{t}(\hat{\omega}) \mathbb{E}_{\hat{\mu}}\left[\max _{p_{t+1} \in A_{t+1}} \hat{U}_{t+1}\left(p_{t+1}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]\right),
\end{aligned}
$$

where the first equality follows from (ii), the second from (1) for $\left(\mathcal{D},\left(u_{t}, \delta_{t}\right)\right.$ ), the third from (i), (ii), and (v) (and the fact $\phi_{t}$ is a bijection), and the fourth by (iv). Thus, ( $\left.\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ satisfies (1).
$B E B$ : By the "if" direction for BEU, $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ is a BEU representation of $\rho$. It remains to show that $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ satisfies (2). For all $t \leq T-1$ and $\omega \in \Omega, \hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$, we have

$$
\alpha_{0}(\omega) \hat{u}_{t}(\hat{\omega})+\gamma_{t}(\omega)=u_{t}(\omega)=\mathbb{E}_{\mu}\left[U_{T} \mid \mathcal{F}_{t}(\omega)\right]=\alpha_{0}(\omega) \mathbb{E}_{\hat{\mu}}\left[\hat{U}_{T} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]+\mathbb{E}_{\mu}\left[\beta_{T} \mid \mathcal{F}_{t}(\omega)\right]
$$

where the first equality follows from (iv), (v), and (vi), the second from (2) for ( $\mathcal{D},\left(u_{t}, \delta_{t}\right)$ ), and the third from (i), (ii), (iv), (vi) (and the fact that $\phi_{t}$ is a bijection). But since $\gamma_{t}(\omega)=\mathbb{E}_{\mu}\left[\beta_{T} \mid \mathcal{F}_{t}(\omega)\right]$ by (vii), the above implies that $\hat{u}_{t}(\hat{\omega})=\mathbb{E}_{\hat{\mu}}\left[\hat{U}_{T} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]$, whence $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ satisfies (2) with $\hat{\tilde{u}}:=\hat{U}_{T}$.

## J.3.2. "Only If" Directions

$D R E U$ : Throughout the proof, for any $t$ and $E_{t}=\mathcal{F}_{t}(\omega) \in \Pi_{t}$, we let $U_{t}\left(E_{t}\right)$ denote $U_{t}(\omega)$ and likewise for $\hat{U}$; this is well-defined by adaptedness. We construct the sequence ( $\phi_{t}, \alpha_{t}, \beta_{t}$ ) inductively, dealing with the base case $t=0$ and the inductive step simultaneously.

Suppose $t \geq 0$ and that we have constructed ( $\phi_{t^{\prime}}, \alpha_{t^{\prime}}, \beta_{t^{\prime}}$ ) satisfying (i)-(iii) for all $t^{\prime}<t$ (disregard the latter assumption if $t=0$ ). If $t>0$, fix any $E_{t-1}=\mathcal{F}_{t-1}\left(\omega^{*}\right) \in$ $\Pi_{t-1}$, let $\hat{E}_{t-1}:=\phi_{t-1}\left(E_{t-1}\right)$, and let $\Pi_{t}\left(E_{t-1}\right):=\left\{E_{t}=\mathcal{F}_{t}(\omega) \in \Pi_{t}: \mathcal{F}_{t-1}(\omega)=E_{t-1}\right\}$ and
$\hat{\Pi}_{t}\left(\hat{E}_{t-1}\right):=\left\{\hat{E}_{t}=\hat{\mathcal{F}}_{t}(\hat{\omega}) \in \hat{\Pi}_{t}: \hat{\mathcal{F}}_{t-1}(\hat{\omega})=\hat{E}_{t-1}\right\}$. As in the proof of Lemma B.2, we can repeatedly apply Lemma E. 2 to find a separating history for $E_{t-1}=\mathcal{F}_{t-1}\left(\omega^{*}\right)$, that is, a history $h^{t-1}=\left(B_{0}, q_{0}, \ldots, B_{t-1}, q_{t-1}\right) \in \mathcal{H}_{t-1}^{*}$ such that $\left\{\omega \in \Omega: q_{k} \in M\left(B_{k}, U_{k}(\omega)\right)\right\}=$ $\mathcal{F}_{k}\left(\omega^{*}\right)$ for all $k=0, \ldots, t-1$. By inductive hypothesis, $h^{t-1}$ is then also a separating history for $\hat{E}_{t-1}$. Thus, by Lemma E. 3 (and the translation to $S$-based DREU in Proposition A.1), $C\left(h^{t-1}\right)=E_{t-1}$ and $\hat{C}\left(h^{t-1}\right)=\hat{E}_{t-1}$. If $t=0$, then in the following we let $E_{t-1}:=\Omega, \hat{E}_{t-1}:=\hat{\Omega}, \Pi_{t}\left(E_{t-1}\right):=\Pi_{0}, \hat{\Pi}_{t}\left(E_{t-1}\right):=\hat{\Pi}_{0}$, and we disregard all references to the separating history.

Enumerate $\Pi_{t}\left(E_{t-1}\right)=\left\{E_{t}^{i}: i=1, \ldots, m\right\}$ with corresponding utilities $U_{t}^{i}:=U_{t}\left(E_{t}^{i}\right)$ and $\hat{\Pi}_{t}\left(\hat{E}_{t-1}\right)=\left\{\hat{E}_{t}^{j}: j=1, \ldots, \hat{m}\right\}$ with corresponding utilities $\hat{U}_{0}^{j}:=\hat{U}_{t}\left(\hat{E}_{t}^{j}\right)$. Since $\left(\mathcal{F}_{t}, U_{t}\right)$ and $\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}\right)$ are both simple, we have $\mu\left(E_{t}^{i}\right)>0$ for all $i$ and $U_{t}^{i} \not \approx U_{t}^{i^{\prime}}$ for $i \neq i^{\prime}$, and likewise $\hat{\mu}\left(\hat{E}_{t}^{j}\right)>0$ for all $j$ and $\hat{U}_{t}^{j} \not \approx \hat{U}_{t}^{j^{\prime}}$ for $j \neq j^{\prime}$. Note that, for every $j$, there exists a unique $i(j)$ such $U_{t}^{i(j)} \approx \hat{U}_{t}^{j}$. Indeed, if such an $i(j)$ exists, it is unique because all the $U_{t}^{i}$ represent different preferences. And the desired $i(j)$ exists, since otherwise by Lemma E.2, we can find a menu $B_{t}=\left\{q_{t}^{i}: i=1, \ldots, m\right\} \cup\left\{\hat{q}_{t}^{j}\right\}$ such that $M\left(B_{t}, U_{t}^{i}\right)=\left\{q_{t}^{i}\right\}$ for each $i$ and $M\left(B_{t}, \hat{U}_{t}^{j}\right)=\left\{\hat{q}_{t}^{j}\right\}$. We can additionally assume (by replacing $h^{t-1}$ with an appropriate mixture if need be) that $h^{t-1} \in \mathcal{H}_{t-1}^{*}\left(B_{t}\right)$. Since $\mathcal{D}$ and $\hat{\mathcal{D}}$ both represent $\rho$, we obtain

$$
0=\mu\left[C\left(\hat{q}_{t}^{j}, B_{t}\right) \mid E_{t-1}\right]=\rho_{t}\left(\hat{q}_{t}^{j} ; B_{t} \mid h^{t-1}\right)=\hat{\mu}\left[\hat{C}\left(\hat{q}_{t}^{j}, B_{t}\right) \mid \hat{E}_{t-1}\right) \geq \hat{\mu}\left(\hat{E}_{t}^{j} \mid \hat{E}_{t-1}\right)>0
$$

a contradiction. Similarly, for every $i$, there exists a unique $j(i)$ such that $\hat{U}_{t}^{j(i)} \approx U_{t}^{i}$. Thus, defining $\phi_{t}: \Pi_{t}\left(E_{t-1}\right) \rightarrow \hat{\Pi}_{t}\left(\hat{E}_{t-1}\right)$ by $\phi_{t}\left(E_{t}^{i}\right)=\hat{E}_{t}^{j(i)}$ yields a bijection. By construction, $U_{t}\left(E_{t}^{i}\right) \approx \hat{U}_{t}\left(\phi_{t}\left(E_{t}^{i}\right)\right)$ for all $i$, so we can find $\alpha_{t}\left(E_{t}^{i}\right) \in \mathbb{R}_{++}$and $\beta\left(E_{t}^{i}\right) \in \mathbb{R}$ such that $U_{t}\left(E_{t}^{i}\right)=\alpha_{t}\left(E_{t}^{i}\right) \hat{U}_{t}\left(\phi_{t}\left(E_{t}^{i}\right)\right)+\beta\left(E_{t}^{i}\right)$. Defining $\alpha(\omega)=\alpha\left(\mathcal{F}_{t}(\omega)\right)$ and $\beta(\omega)=\beta\left(\mathcal{F}_{t}(\omega)\right)$, this yields $\mathcal{F}_{t}$-measurable maps $\alpha_{t}, \beta_{t}: E_{t-1} \rightarrow \mathbb{R}$ such that (ii) holds for all $\omega \in E_{t-1}$. Moreover, applying Lemma E. 2 again, we can find a menu $D_{t}=\left\{r_{t}^{i}: i=1, \ldots, n\right\}$ such that $M\left(D_{t}, U_{t}^{i}\right)=\left\{r_{t}^{i}\right\}$ for each $i$. Again, slightly perturbing the separating history $h^{t-1}$ for $E_{t-1}$ if need be, we can assume that $h^{t-1} \in \mathcal{H}_{t-1}^{*}\left(D_{t}\right)$. Then, by the representation, $\mu\left(E_{t}^{i} \mid E_{t-1}\right)=\rho_{t}\left(r_{t}^{i} ; D_{t}^{i} \mid h^{t-1}\right)=\hat{\mu}\left(\phi_{t}\left(E_{t}^{i}\right) \mid \hat{E}_{t-1}\right)$ for all $i$, yielding (i).

To show (iii), consider any $p_{t} \in A_{t}$, where we can again assume $h^{t-1} \in \mathcal{H}_{t-1}^{*}\left(\frac{1}{2} A_{t}+\right.$ $\left.\frac{1}{2} D_{t}\right)$. Let $B_{t}^{i}:=\left\{w \in \mathbb{R}^{X_{t}}: p_{t} \in M\left(M\left(A_{t}, U_{t}\left(E_{t}^{i}\right)\right), w\right)\right\}$. Note that by (ii), $B_{t}^{i}=\left\{w \in \mathbb{R}^{X_{t}}\right.$ : $\left.p_{t} \in M\left(M\left(A_{t}, \hat{U}_{t}\left(\phi_{t}\left(E_{t}^{i}\right)\right)\right), w\right)\right\}$. Thus, $\mu\left(\left\{W_{t} \in B_{t}\right\} \mid E_{t}^{i}\right)=\mu\left(C\left(p_{t}, A_{t}\right) \mid E_{t}^{i}\right)$ and $\hat{\mu}\left(\left\{\hat{W}_{t} \in\right.\right.$ $\left.\left.B_{t}\right\} \mid \phi_{t}\left(E_{t}^{i}\right)\right)=\hat{\mu}\left(\hat{C}\left(p_{t}, A_{t}\right) \mid \phi_{t}\left(E_{t}^{i}\right)\right)$. But since $\mathcal{D}$ and $\hat{\mathcal{D}}$ both represent $\rho$ and by choice of $D_{t}$,

$$
\begin{aligned}
& \mu\left(E_{t}^{i} \mid E_{t-1}\right) \mu\left[C\left(p_{t}, A_{t}\right) \mid E_{t}^{i}\right] \\
&=\mu\left[\left.C\left(\frac{1}{2} p_{t}+\frac{1}{2} r_{t}^{i}, \frac{1}{2} A_{t}+\frac{1}{2} D_{t}\right) \right\rvert\, E_{t-1}\right] \\
&=\rho_{t}\left(\frac{1}{2} p_{t}+\frac{1}{2} r_{t}^{i} ; \left.\frac{1}{2} A_{t}+\frac{1}{2} D_{t} \right\rvert\, h^{t-1}\right) \\
&=\hat{\mu}\left[\left.\hat{C}\left(\frac{1}{2} p_{t}+\frac{1}{2} r_{t}^{i}, \frac{1}{2} A_{t}+\frac{1}{2} D_{t}\right) \right\rvert\, \hat{E}_{t-1}\right]=\hat{\mu}\left(\phi_{t}\left(E_{t}^{i}\right) \mid \hat{E}_{t-1}\right) \hat{\mu}\left[\hat{C}\left(p_{t}, A_{t}\right) \mid \phi_{t}\left(E_{t}^{i}\right)\right]
\end{aligned}
$$

which implies $\mu\left[C\left(p_{t}, A_{t}\right) \mid E_{t}^{i}\right]=\hat{\mu}\left[\hat{C}\left(p_{t}, A_{t}\right) \mid \phi_{t}\left(E_{t}^{i}\right)\right]$, since, by (i), we have $\mu\left(E_{t}^{i} \mid E_{t-1}\right)=$ $\hat{\mu}\left(\phi_{t}\left(E_{t}^{i}\right) \mid \hat{E}_{t-1}\right)$. Thus, $\mu\left(\left\{W_{t} \in B_{t}\right\} \mid E_{t}^{i}\right)=\hat{\mu}\left(\left\{\hat{W}_{t} \in B_{t}\right\} \mid \phi_{t}\left(E_{t}^{i}\right)\right)$, as required.

Finally, note that the collection $\left\{\Pi_{t}\left(E_{t-1}\right): E_{t-1} \in \Pi_{t-1}\right\}$ partitions $\Pi_{t}$, and similarly $\left\{\hat{\Pi}_{t}\left(\hat{E}_{t-1}\right): \hat{E}_{t-1} \in \hat{\Pi}_{t-1}\right\}$ partitions $\hat{\Pi}_{t}$. Thus, applying the above construction for every $E_{t-1} \in \Pi_{t-1}$ yields a bijection $\phi_{t}: \Pi_{t} \rightarrow \hat{\Pi}_{t}$ and $\mathcal{F}_{t}$-measurable maps $\alpha_{t}: \Omega \rightarrow \mathbb{R}_{++}$and $\beta_{t}: \Omega \rightarrow \mathbb{R}$ such that (i)-(iii) are satisfied.
$B E U$ : The "only if" part for DREU yields sequences ( $\phi_{t}, \alpha_{t}, \beta_{t}$ ) such that (i)-(iii) are satisfied. It remains to show that (iv) and (v) hold. Throughout the proof, for any $E_{t}=\mathcal{F}_{t}(\omega) \in \Pi_{t}$, we sometimes use $U_{t}\left(E_{t}\right), \delta_{t}\left(E_{t}\right), \alpha_{t}\left(E_{t}\right), \beta_{t}\left(E_{t}\right)$ to denote $U_{t}(\omega), \delta_{t}(\omega)$ $\alpha_{t}(\omega), \beta_{t}(\omega)$; this is well-defined since they are $\mathcal{F}_{t}$-measurable. We also let $\mathcal{F}_{t-1}\left(E_{t}\right):=$ $\mathcal{F}_{t-1}(\omega)$; this is well-defined since $\mathcal{F}_{t}(\omega)=\mathcal{F}_{t}\left(\omega^{\prime}\right)$ implies $\mathcal{F}_{t-1}(\omega)=\mathcal{F}_{t-1}\left(\omega^{\prime}\right)$, as $\left(\mathcal{F}_{t}\right)$ is a filtration.

For (iv), fix any $\omega$ and $t \leq T-1$. Let $E_{t}:=\mathcal{F}_{t}(\omega)$ and pick any $A_{t+1}, B_{t+1}$ and $z_{t}$. Then

$$
\begin{align*}
& U_{t}\left(E_{t}\right)\left(z_{t}, A_{t+1}\right)-U_{t}\left(E_{t}\right)\left(z_{t}, B_{t+1}\right) \\
&= \alpha_{t}\left(E_{t}\right)\left(\hat{U}_{t}\left(\phi_{t}\left(E_{t}\right)\right)\left(z_{t}, A_{t+1}\right)-\hat{U}_{t}\left(\phi_{t}\left(E_{t}\right)\right)\left(z_{t}, B_{t+1}\right)\right) \\
&= \alpha_{t}\left(E_{t}\right) \hat{\delta}_{t}\left(\phi_{t}\left(E_{t}\right)\right) \sum_{\hat{E}_{t+1} \in \hat{I}_{t+1}} \hat{\mu}\left(\hat{E}_{t+1} \mid \phi_{t}\left(E_{t}\right)\right)\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\hat{E}_{t+1}\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\hat{E}_{t+1}\right)\right] \\
&= \alpha_{t}\left(E_{t}\right) \hat{\delta}_{t}\left(\phi_{t}\left(E_{t}\right)\right) \sum_{E_{t+1} \in \Pi_{t+1}} \hat{\mu}\left(\phi_{t+1}\left(E_{t+1}\right) \mid \phi_{t}\left(E_{t}\right)\right) \\
& \times\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right] \\
&= \alpha_{t}\left(E_{t}\right) \hat{\delta}_{t}\left(\phi_{t}\left(E_{t}\right)\right) \sum_{E_{t+1} \in \Pi_{t+1}} \mu\left(E_{t+1} \mid E_{t}\right) \\
& \times\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right] \\
&= \alpha_{t}\left(E_{t}\right) \hat{\delta}_{t}\left(\phi_{t}\left(E_{t}\right)\right) \sum_{E_{t+1} \text { s.t. } \mathcal{F}_{t}\left(E_{t+1}\right)=E_{t}} \mu\left(E_{t+1} \mid E_{t}\right) \\
& \times\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right] \tag{39}
\end{align*}
$$

where the first equality holds by (ii), the second equality follows from $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}\right)\right)$ being a BEU representation, the third equality from the fact that $\phi_{t}$ is a bijection, the fourth equality from (i), and the fifth equality from the fact that $\mu\left(\mathcal{F}_{t+1}\left(\omega^{\prime}\right) \mid E_{t}\right)>0$ iff $\mathcal{F}_{t}\left(\omega^{\prime}\right)=E_{t}$.

At the same time, we have

$$
\begin{aligned}
& U_{t}\left(E_{t}\right)\left(z_{t}, A_{t+1}\right)-U_{t}\left(E_{t}\right)\left(z_{t}, B_{t+1}\right) \\
& \quad=\delta_{t}\left(E_{t}\right) \sum_{E_{t+1} \in I_{t+1}} \mu\left(E_{t+1} \mid E_{t}\right)\left[\max _{A_{t+1}} U_{t+1}\left(E_{t+1}\right)-\max _{B_{t+1}} U_{t+1}\left(E_{t+1}\right)\right. \\
& \quad=\delta_{t}\left(E_{t}\right) \sum_{E_{t+1} \in I_{t+1}} \mu\left(E_{t+1} \mid E_{t}\right) \alpha_{t+1}\left(E_{t+1}\right)
\end{aligned}
$$

$$
\begin{align*}
& \times\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right] \\
= & \delta_{t}\left(E_{t}\right) \sum_{E_{t+1} \text { s.t. } \mathcal{F}_{t}\left(E_{t+1}\right)=E_{t}} \mu\left(E_{t+1} \mid E_{t}\right) \alpha_{t+1}\left(E_{t+1}\right) \\
& \times\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right], \tag{40}
\end{align*}
$$

where the first equality follows from $\left(\mathcal{D},\left(u_{t}, \delta_{t}\right)\right)$ being a BEU representation, the second equality from (ii), and the third equality from the fact that $\mu\left(\mathcal{F}_{t+1}\left(\omega^{\prime}\right) \mid E_{t}\right)>0$ iff $\mathcal{F}_{t}\left(\omega^{\prime}\right)=$ $E_{t}$.

Combining (39) and (40), we have that for all $A_{t+1}$ and $B_{t+1}$,

$$
\begin{align*}
& \hat{\delta}_{t}\left(\phi_{t}\left(E_{t}\right)\right) \sum_{E_{t+1} \text { s.t. }}^{\mathcal{F}_{t}\left(E_{t+1}\right)=E_{t}} \mu\left(E_{t+1} \mid E_{t}\right) \alpha_{t}\left(E_{t}\right) \\
& \quad \times\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right] \\
& =\delta_{t}\left(E_{t}\right) \sum_{E_{t+1} \text { s.t. } \mathcal{F}_{t}\left(E_{t+1}\right)=E_{t}} \mu\left(E_{t+1} \mid E_{t}\right) \alpha_{t+1}\left(E_{t+1}\right) \\
& \quad \times\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right] . \tag{41}
\end{align*}
$$

Since $\left(\hat{\mathcal{F}}_{t}, \hat{U}_{t}\right)$ is simple and $\phi_{t}$ is a bijection, $\hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right) \not \approx \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}^{\prime}\right)\right)$ for all distinct $E_{t+1}, E_{t+1}^{\prime}$ with $\mathcal{F}_{t}\left(E_{t+1}\right)=E_{t}=\mathcal{F}_{t}\left(E_{t+1}^{\prime}\right)$. So by Lemma E.2, we can find a menu $A_{t+1}:=\left\{q_{t+1}^{E_{t+1}}: \mathcal{F}_{t}\left(E_{t+1}\right)=E_{t}\right\}$ such that, for all $E_{t+1}$ with $\mathcal{F}_{t}\left(E_{t+1}\right)=E_{t}$, we have $M\left(A_{t+1}, \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)=\left\{q_{t+1}^{E_{t+1}}\right\}\right.$. Let $E_{t+1}^{*}:=\mathcal{F}_{t+1}(\omega)$ and let $B_{t+1}=A_{t+1} \backslash\left\{q_{t+1}^{E_{t+1}^{*}}\right\}$. Then in (41), $\left[\max _{A_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)-\max _{B_{t+1}} \hat{U}_{t+1}\left(\phi_{t+1}\left(E_{t+1}\right)\right)\right] \neq 0$ iff $E_{t+1}=E_{t+1}^{*}$. Hence, (41) implies $\frac{\hat{\delta}_{t}\left(\phi_{t}\left(E_{t}\right)\right)}{\delta_{t}\left(E_{t}\right)} \alpha_{t}(\omega)=\frac{\hat{\delta}_{t}\left(\phi_{t}\left(E_{t}\right)\right.}{\delta_{t}\left(E_{t}\right)} \alpha_{t}\left(E_{t}\right)=\alpha_{t+1}\left(E_{t+1}^{*}\right)=\alpha_{t+1}(\omega)$. Since this is true for all $t \leq T-1$, (iv) follows.

For (v), note that the claim for $T$ is immediate from (ii) and the fact that $U_{T}=u_{T}$, $\hat{U}_{T}=\hat{u}_{T}$. Next, fix any $\omega \in \Omega, \hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right), t \leq T-1$, and $\left(z,\left\{p_{t+1}\right\}\right)$. Then

$$
\begin{align*}
U_{t}(\omega)\left(z,\left\{p_{t+1}\right\}\right)= & u_{t}(\omega)(z)+\delta_{t}(\omega) \mathbb{E}_{\mu}\left[U_{t+1}\left(p_{t+1}\right) \mid \mathcal{F}_{t}(\omega)\right] \\
= & u_{t}(\omega)(z)+\alpha_{t}(\omega) \hat{\delta}_{t}(\hat{\omega}) \mathbb{E}_{\hat{\mu}}\left[\hat{U}_{t+1}\left(p_{t+1}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right] \\
& +\delta_{t}(\omega) \mathbb{E}_{\mu}\left[\beta_{t+1} \mid \mathcal{F}_{t}(\omega)\right] \tag{42}
\end{align*}
$$

where the first equality follows from $\left(\mathcal{D},\left(u_{t}, \delta_{t}\right)\right)$ being an evolving utility representation and the second equality from (i), (ii), (iv) (and the fact that $\phi_{t}$ is a bijection). At the same time, we have

$$
\begin{align*}
U_{t}(\omega)\left(z,\left\{p_{t+1}\right\}\right) & =\alpha_{t}(\omega) \hat{U}_{t}(\hat{\omega})\left(z,\left\{p_{t+1}\right\}\right)+\beta_{t}(\omega) \\
& =\alpha_{t}(\omega) \hat{u}_{t}(\omega)(z)+\alpha_{t}(\omega) \hat{\delta}_{t}(\hat{\omega}) \mathbb{E}_{\hat{\mu}}\left[\hat{U}_{t+1}\left(p_{t+1}\right) \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]+\beta_{t}(\omega) \tag{43}
\end{align*}
$$

where the first equality follows from (ii) and the second equality from $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ being an evolving utility representation. Combining (42) and (43) yields the desired claim.
$B E B$ : The "only if" part for BEU yields sequences $\left(\phi_{t}, \alpha_{t}, \beta_{t}\right)$ such that (i)-(v) are satisfied. It remains to show that (vi) and (vii) hold.

For (vi), fix any $\omega \in \Omega$ and $t$. Take $\bar{\ell}, \underline{\ell}$ from Condition D. 1 (Uniform Ranked Pair). Then, based on the representation, one can verify that $u_{t}(\omega)(\bar{\ell})>u_{t}(\omega)(\underline{\ell})$ holds by following the similar line as in Lemma D.1.

Note that by (2) and iterated expectations, we have

$$
U_{t}(\omega)\left(\ell_{t}, \ell_{t+1}, A_{t+2}\right)=u_{t}(\omega)\left(\ell_{t}\right)+\delta_{t}(\omega)\left(u_{t}(\omega)\left(\ell_{t+1}\right)+\mathbb{E}\left[\delta_{t+1} \max _{A_{t+2}} U_{t+2} \mid \mathcal{F}_{t}(\omega)\right]\right)
$$

for any $\left(\ell_{t}, \ell_{t+1}, A_{t+2}\right)$. Hence, $U_{t}(\omega)\left(\bar{\ell}, \underline{\ell}, A_{t+2}\right)-U_{t}(\omega)(\eta \bar{\ell}+(1-\eta) \underline{\ell}, \eta \bar{\ell}+(1-$ $\left.\eta) \underline{\ell}, A_{t+2}\right)=0$ if and only if $\eta=\frac{1}{1+\delta_{t}(\omega)}$.

Now pick any $\hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$. Then, since $\left(\hat{\mathcal{D}},\left(\hat{u}_{t}, \hat{\delta}_{t}\right)\right)$ is also a BEU representation, by the same reasoning as above we have that $\hat{U}_{t}(\hat{\omega})\left(\bar{\ell}, \underline{\ell}, A_{t+2}\right)-\hat{U}_{t}(\hat{\omega})(\eta \bar{\ell}+(1-\eta) \underline{\ell}, \eta \bar{\ell}+$ $\left.(1-\eta) \underline{\ell}, A_{t+2}\right)=0$ if and only if $\eta=\frac{1}{1+\hat{\delta}_{t}(\hat{\omega})}$. By (ii), this implies that $\delta_{t}(\omega)=\hat{\delta}_{t}(\hat{\omega})$, proving (vi).

Finally, (vii) is verified by observing that for any $t, \omega$, and $\hat{\omega} \in \phi_{t}\left(\mathcal{F}_{t}(\omega)\right)$,

$$
\gamma_{t}(\omega)=u_{t}(\omega)-\alpha_{t}(\omega) \hat{u}_{t}(\hat{\omega})=\mathbb{E}_{\mu}\left[u_{T} \mid \mathcal{F}_{t}(\omega)\right]-\alpha_{t}(\omega) \mathbb{E}_{\hat{\mu}}\left[\hat{u}_{T} \mid \hat{\mathcal{F}}_{t}(\hat{\omega})\right]=\mathbb{E}_{\mu}\left[\beta_{T} \mid \mathcal{F}_{t}(\omega)\right]
$$

where the first equality uses (v), the second uses (2), and the third uses (i), (v), and $\alpha_{t}(\omega)=\alpha_{T}(\omega)$ (which follows from (iv) and (vi)).

## J.4. Proof of Proposition I. 2

(i) $\Longrightarrow$ (ii): Suppose that $\rho^{Z}$ admits a BEU representation $\left(\Omega, \mathcal{F}^{*}, \mu,\left(\mathcal{F}_{t}, U_{t}, W_{t}\right.\right.$, $\left.u_{t}, \delta_{t}\right)$ ) and satisfies Axioms I. 1 and I.2. For each $t$, we can pick a finite collection $\mathcal{U}_{t}=\left\{u_{t}^{1}, \ldots, u_{t}^{m_{t}}\right\}$ of ordinally distinct felicities such that $\left[\mathcal{U}_{t}\right]=\left[\left\{u_{t}(\omega): \omega \in \Omega\right\}\right]$. Condition D. 1 (Uniformly Ranked Pairs) ensures that these felicities are nonconstant. Let $\mathcal{U}:=\left\{u^{1}, \ldots, u^{m}\right\}$, where $m=m_{0}$ and $u^{i}=u_{0}^{i}$ for all $i=1, \ldots, m$. Define $\xi \in \Delta^{\circ}(\mathcal{U})$ by $\xi\left(u^{i}\right):=\mu\left(u_{0}(\omega) \approx u^{i}\right)$ for all $i$.

By Axiom I.1, for each degenerate consumption history $d_{Z}^{t-1}, \rho_{0}^{Z}$ and $\rho_{t}^{Z}\left(\cdot \mid d_{Z}^{t-1}\right)$ represent the same static stochastic choice rule over finite menus of consumption lotteries without ties. Hence, the same argument in the proof of Proposition I. 1 implies that after suitable relabeling, we can assume that $m_{t}=m$ and $u_{t}^{i} \approx u^{i}$ for all $i$ and $\mu\left(u_{t}(\omega) \approx u^{i}\right)=\xi\left(u^{i}\right)$. Thus, property (i) of the Markov evolving utility representation is satisfied.

Next, we construct a menu $L=\left\{\ell^{1}, \ldots, \ell^{m}\right\} \in \mathcal{L}_{0}^{*}$ such that $u^{i}\left(\ell^{i}\right)>u^{i}\left(\ell^{j}\right)$ for all $i \neq j$ and such that each $\left(L, \ell^{i}\right)$ is a consumption atom. Indeed, since the $u^{i}$ are nonconstant and ordinally distinct, Lemma E. 2 yields a menu $L=\left\{\ell^{1}, \ldots, \ell^{m}\right\} \in \mathcal{L}_{0}^{*}$ such that $u^{i}\left(\ell^{i}\right)>u^{i}\left(\ell^{j}\right)$ for all $i \neq j$; moreover, up to mixing all $\ell^{i}$ with some full-support lottery $\ell \in \Delta^{\circ}(Z)$, we can assume that $L \subseteq \Delta^{\circ}(Z)$. By the representation, $\rho_{0}\left(\ell^{i}, L\right)=\mu\left(u_{0}(\omega) \approx\right.$ $\left.u^{i}\right)>0$ for all $i$. Finally, suppose that $L^{\prime} \in \mathcal{L}^{*}$ and $L^{\prime} \supseteq L$. Then, either $\ell^{i} \in M\left(L^{\prime}, u^{i}\right)$, in which case $\rho_{0}\left(\ell^{i}, L^{\prime}\right)=\mu\left(u_{0}(\omega) \approx u^{i}\right)=\rho_{0}\left(\ell^{i}, L\right)$; or $\ell^{i} \notin M\left(L^{\prime}, u^{i}\right)$, in which case $\rho_{0}\left(\ell^{i}, L^{\prime}\right)=0$ since $u^{j}\left(\ell^{i}\right)<u^{j}\left(\ell^{j}\right)$ for all $j \neq i$. Thus, each $\left(L, \ell^{i}\right)$ is a consumption atom.

Now, consider any $t \leq T-1$ and any $u_{0}, \ldots, u_{t+1} \in \mathcal{U}$. For each $s=0, \ldots, t+1$, let $\ell_{s}$ denote the maximizer of $u_{s}$ in menu $L$ that we constructed in the previous paragraph.

Then, for any degenerate consumption history $d_{Z}^{t-1}$, we have

$$
\begin{aligned}
& \mu\left(u_{t+1}(\omega) \approx u_{t+1} \mid u_{0}(\omega) \approx u_{0}, \ldots, u_{t-1}(\omega) \approx u_{t-1}, u_{t}(\omega) \approx u_{t}\right) \\
& \quad=\rho_{t+1}^{Z}\left(\ell_{t+1}, L \mid L, \ell_{0}, \ldots, L, \ell_{t-1}, L, \ell_{t}\right) \\
& \quad=\rho_{1}^{Z}\left(\ell_{t+1}, L \mid L, \ell_{t}\right)=\rho_{t+1}^{Z}\left(\ell_{t+1}, L \mid d_{Z}^{t-1}, L_{t}, \ell_{t}\right) \\
& \quad=\mu\left(u_{t+1}(\omega) \approx u_{t+1} \mid u_{t}(\omega) \approx u_{t}\right)
\end{aligned}
$$

where the first and fourth equalities hold by the BEU representation of $\rho$ together with the fact that $M\left(L, u^{i}\right)=\left\{\ell^{i}\right\}$ for all $i$, and the second and third equalities follow from Axiom I. 2 and the fact that $\left(L, \ell_{t}\right)$ is a consumption atom. This establishes property (ii) of the Markov evolving utility representation.

Finally, set $\Pi_{i, j}:=\mu\left(u_{1}(\omega) \approx u^{j} \mid u_{0}(\omega) \approx u^{i}\right)$ for all $i, j=1, \ldots, m$. Note that this yields a right stochastic matrix $\Pi$, because $\sum_{j} \Pi_{i, j}=1$ by part (i) of Definition 14 that we established above. Consider any $i, j=1, \ldots, m$. Then, letting $L, \ell^{i}$, and $\ell^{j}$ be as constructed in the third paragraph, we have for any degenerate consumption history $d_{Z}^{t-1}$ that

$$
\begin{aligned}
\mu\left(u_{t+1}(\omega) \approx u^{j} \mid u_{t}(\omega) \approx u^{i}\right) & =\rho_{t+1}^{Z}\left(\ell^{j}, L \mid d_{Z}^{t-1}, L, \ell^{i}\right) \\
& =\rho_{1}^{Z}\left(\ell^{j}, L \mid L, \ell^{i}\right)=\mu\left(u_{1}(\omega) \approx u^{j} \mid u_{0}(\omega) \approx u^{i}\right)=\Pi_{i, j}
\end{aligned}
$$

where the first and third equalities again follow from the representation and the construction of $L$ and the second equality holds by Axiom I. 2 and the fact that ( $L, \ell^{i}$ ) is a consumption atom. This proves property (iii) of the Markov evolving utility representation.
(ii) $\Longrightarrow$ (i): Suppose that $\rho$ admits a Markov evolving utility representation. To show that Axiom I. 1 holds, consider any degenerate consumption history $d_{Z}^{t-1}, L \in \mathcal{L}_{0}^{*} \cap$ $\mathcal{L}_{t}^{*}\left(d_{Z}^{t-1}\right), \ell \in L$. Then

$$
\begin{aligned}
\rho_{0}^{Z}(\ell, L) & =\mu\left\{\omega: \ell \in M\left(L, u_{0}(\omega)\right)\right\} \\
& =\xi\left\{u^{i} \in \mathcal{U}: \ell \in M\left(L, u^{i}\right)\right\}=\mu\left\{\omega: \ell \in M\left(L, u_{t}(\omega)\right)\right\}=\rho_{t}^{Z}\left(\ell, L \mid d_{Z}^{t-1}\right)
\end{aligned}
$$

where the first and final equalities hold by the BEU representation and the fact that $L$ is without ties and $d_{Z}^{t-1}$ is degenerate, and the second and third equalities hold by property (i) of the Markov evolving utility representation.

To establish Axiom I.2, consider any consumption atom $(L, \ell)$. We first show that there exists $u^{i} \in \mathcal{U}$ such that $\mu\left(\ell \in M\left(L, u_{t}(\omega)\right)\right)=\mu\left(u_{t}(\omega) \approx u^{i}\right)$ for all $t$. Since $L$ is without ties, it suffices to show that there is a unique $i \in\{1, \ldots, m\}$ such that $\ell \in M\left(L, u^{i}\right)$. To see this, note that since $\mu\left(\ell \in M\left(L, u_{0}(\omega)\right)\right)=\rho_{0}(\ell, L)>0$, there exists $u^{i}$ such that $\ell \in$ $M\left(L, u^{i}\right)$. Suppose for a contradiction that $\ell \in M\left(L, u^{j}\right)$ for some $j \neq i$. Since $u^{i} \not \approx u^{j}$, we can find $m \in \Delta(Z)$ such that $u^{i}(\ell)>u^{i}(m)$ and $u^{j}(\ell)<u^{j}(m) .{ }^{87}$ Then, letting $M=$ $L \cup\{m\}$, we have that $\xi\left(u^{i}\right) \leq \rho_{0}(\ell, M) \leq \rho_{0}(\ell, L)-\xi\left(u^{j}\right)$. Thus, $\rho_{0}(\ell, M) \notin\left\{\rho_{0}(\ell, L), 0\right\}$, contradicting the fact that $(L, \ell)$ is a consumption atom.

[^5]Now, consider any consumption history $h_{Z}^{t-1}$ without ties. For any $L^{\prime} \in \mathcal{L}_{t}^{*}\left(h_{Z}^{t-1}\right)$ and $\ell^{\prime} \in L^{\prime}$, we have

$$
\begin{aligned}
\rho_{1}^{Z}\left(\ell^{\prime}, L^{\prime} \mid L, \ell\right) & =\mu\left(\ell^{\prime} \in M\left(L^{\prime}, u_{1}(\omega)\right) \mid u_{0}(\omega) \approx u^{i}\right) \\
& =\sum_{\left\{j: \ell^{\prime} \in M\left(L^{\prime}, u^{j}\right)\right\}} \mu\left(u_{1}(\omega) \approx u^{j} \mid u_{0}(\omega) \approx u^{i}\right)=\sum_{\left\{j: \ell^{\prime} \in M\left(L^{\prime}, u^{j}\right)\right\}} \Pi_{i, j} \\
& =\sum_{\left\{j: \ell^{\prime} \in M\left(L^{\prime}, u^{j}\right)\right\}} \mu\left(u_{t+1}(\omega) \approx u^{j} \mid u_{t}(\omega) \approx u^{i}\right) \\
& =\mu\left(\ell^{\prime} \in M\left(L^{\prime}, u_{t+1}(\omega)\right) \mid u_{t}(\omega) \approx u^{i}\right),
\end{aligned}
$$

where the second and final equalities follow from property (i) of the Markov evolving utility representation and the fact that $L^{\prime}$ is without ties, and the third and fourth equalities follow from property (iii) of the Markov evolving utility representation.

Moreover, letting $\mathcal{U}\left(h_{Z}^{t-1}\right)$ denote the set of all sequences of felicity realizations from $\mathcal{U}$ that are consistent with history $h_{Z}^{t-1},{ }^{88}$ we have

$$
\begin{aligned}
& \rho_{t+1}^{Z}\left(\ell^{\prime}, L^{\prime} \mid h_{Z}^{t-1}, L, \ell\right) \\
& \quad=\mu\left(\ell^{\prime} \in M\left(L^{\prime}, u_{t+1}(\omega)\right) \mid u_{t}(\omega) \approx u^{i}, \omega \in C\left(h_{Z}^{t-1}\right)\right) \\
& = \\
& \quad\left(\sum_{\left(u_{0}, \ldots, u_{t-1}\right) \in \mathcal{U}\left(h_{Z}^{t-1)}\right.} \mu\left(\ell^{\prime} \in M\left(L^{\prime}, u_{t+1}(\omega)\right) \mid u_{t}(\omega) \approx u^{i}, \bigcap_{s=0}^{t-1}\left\{u_{s}(\omega) \approx u_{s}\right\}\right)\right. \\
& \left.\quad \times \mu\left(u_{t}(\omega) \approx u^{i}, \bigcap_{s=0}^{t-1}\left\{u_{s}(\omega) \approx u_{s}\right\}\right)\right) \\
& \\
& \quad /\left(\sum_{\left(u_{0}, \ldots, u_{t-1}\right) \in \mathcal{U}\left(h_{Z}^{t-1}\right)} \mu\left(u_{t}(\omega) \approx u^{i}, \bigcap_{s=0}^{t-1}\left\{u_{s}(\omega) \approx u_{s}\right\}\right)\right. \\
& = \\
& \quad \mu\left(\ell^{\prime} \in M\left(L^{\prime}, u_{t+1}(\omega)\right) \mid u_{t}(\omega) \approx u^{i}\right),
\end{aligned}
$$

where the third equality follows from property (ii) of the Markov evolving utility representation. Combining the previous two paragraphs, we have $\rho_{1}^{Z}\left(\ell^{\prime}, L^{\prime} \mid L, \ell\right)=$ $\rho_{t+1}^{Z}\left(\ell^{\prime}, L^{\prime} \mid h_{Z}^{t-1}, L, \ell\right)$. This establishes Axiom I.2.

[^1]:    ${ }^{83}$ The existence of such a function follows by the measurable selection theorem.

[^2]:    ${ }^{84}$ Note that the exact specification of $\left(\hat{W}_{t}\right)$ is irrelevant in this argument because we restrict attention to menus without ties.

[^3]:    ${ }^{85}$ To see why such a construction is possible, first note that all the possible realizations of period- 0 felicities $\hat{u}_{0}(\cdot)$ are ordinally distinct by construction. Take a set of consumption lotteries $\bar{L}$ that separates all the period- 0 felicities $\hat{u}_{0}(\cdot)$ by Lemma E.2. Here we can assume that the sup-norm distance among these lotteries is bounded by $\varepsilon$ by mixing them to a common lottery if necessary, where $\varepsilon:=\min _{z \in Z}\{\ell(z), 1-\ell(z)\}>0$. Let $\bar{\ell} \in \bar{L}$ be the lottery that strictly maximizes $\hat{u}$ in $\bar{L}$. Then we define $\bar{L}^{*}:=\left\{\ell+\bar{\ell}^{\prime \prime}-\bar{\ell}: \bar{\ell}^{\prime \prime} \in \bar{L}\right\}$. This is a well-defined set of lotteries by the construction of $\varepsilon$. Note that this set also separates all period- 0 felicities. Then the desired set $L$ can be constructed by adding $\ell^{\prime}$ to $\bar{L}^{*}$ such that there is no tie (that is guaranteed by slightly perturbing lotteries if necessary).

[^4]:    ${ }^{86}$ Note that the proof does not exploit expected utility; thus, the Axiom holds under any dynamic random utility model.

[^5]:    ${ }^{87}$ Indeed, since $u^{i} \not \approx u^{j}$, we can find $\ell^{i}, \ell^{j}$ such that $u^{i}\left(\ell^{i}\right)>u^{i}\left(\ell^{j}\right)$ and $u^{j}\left(\ell^{j}\right)>u^{j}\left(\ell^{i}\right)$. Then, for small enough $\varepsilon>0, m:=\ell+\varepsilon\left(\ell^{j}-\ell^{i}\right)$ is a well-defined consumption lottery in $\Delta(Z)$, as $\ell \in \Delta^{\circ}(Z)$. Moreover, $u^{i}(\ell)>u^{i}(m)$ and $u^{j}(\ell)<u^{j}(m)$, as required.

[^6]:    ${ }^{88}$ More formally, since $h_{Z}^{t-1}$ is a consumption history without ties and by property (i) of the Markov representation, we can find $\mathcal{U}\left(h_{Z}^{t-1}\right) \subseteq \mathcal{U}^{t}$ such that $C\left(h_{Z}^{t-1}\right)=\left\{\omega: \exists\left(u_{0}, \ldots, u_{t-1}\right) \in \mathcal{U}\left(h^{t-1}\right)\right.$ with $u_{s}(\omega) \approx u_{s}$ for all $s=$ $0, \ldots, t-1\}$.
